1. Introduction

Scottish Sea Fisheries Statistics is a National Statistics publication produced by the Marine Analytical Unit (MAU) in Marine Scotland to provide detailed information on the Scottish fishing industry. The statistics presented in this publication include the tonnage and value of all landings of sea fish and shellfish by Scottish vessels, all landings into Scotland, the rest of the UK and abroad; and the size and structure of the Scottish fishing fleet and employment on Scottish vessels. Data on landings by other UK vessels and landings into the UK is also provided.

All landings tonnages are given in terms of live weight equivalent, overall financial values are provided nominal (not adjusted for inflation) and year on year percentage changes in financial values are calculated at 2019 prices to adjust for inflation. All tables presented here and in previous publications are available for download from the Scottish Sea Fisheries Statistics website (see page 46 for the link).

Tables on method of disposal and vessel numbers by main fishing method have been removed from this publication. Further explanation can be found in Annex 1, page 40.

2. Overview Statistics

2.1. Landings by Scottish vessels

In 2019, Scottish vessels landed 393 thousand tonnes of sea fish and shellfish with a gross value of £582 million. Compared to 2018 there was a small change in the real value of landings (one per cent decrease) and a 12 per cent decrease in the tonnage landed.

The decrease in real value was driven by demersal and pelagic species, as shellfish species increased in value. Demersal species were worth £191 million, a fall of seven per cent compared to 2018. Pelagic species decreased five per cent in value to £195 million. Shellfish value increased 10 per cent to £196 million.

Landings by Scottish vessels accounted for 60 per cent of the value and 62 per cent of the tonnage of all landings by UK vessels in 2019 (Table 22a, page 70). Compared to 2018, the Scottish share of the total UK value has increased by two percentage points and tonnage has decreased by one percentage point.

Mackerel remained the most valuable species landed by the Scottish fleet, representing 27 per cent of the value of all Scottish vessels' landings. *Nephrops* is the second most valuable species, with 15 per cent of the total value. Haddock became the most valuable demersal species overtaking cod with monkfish third. Together, haddock, cod and monkfish account for 20 per cent of the value of Scottish vessels' landings.

As shown in Chart 1, the general trend in the tonnage and value of landings over the past ten years is positive; tonnage has increased by 25,000 tonnes (seven per cent) and value in real terms has increased by £74 million (15 per cent) since 2010.

Chart 1. Total tonnage and value (adjusted to 2019 prices) of all landings by Scottish vessels, 2010 to 2019

2.2. The Scottish fishing fleet

There were 2,098 active Scottish fishing vessels in 2019, an increase of 9 vessels from 2018. In 2019, the number of over ten metre vessels was 539, down 11 vessels (two per cent) from 2018. There were 1,559 vessels in the ten metre and under fleet, an increase of 20 vessels (one per cent) compared to 2018.

2.3. Employment

There were 4,886 fishers employed on Scottish registered vessels at the end of 2019. This figure is up one per cent (26 fishers) since 2018. Compared to 2018, there were 91 less regularly employed fishers (two per cent decrease), 86 more irregularly employed fishers (10 per cent increase) and 31 more crofters.

Figure 1. Overview Statistics Infographic of Scottish landings, fleet and employment 2019

3. Landings

3.1. Landings by Scottish vessels by species type

The one per cent decrease in the real terms value of landings by Scottish vessels to £582 million between 2018 and 2019 was driven by a decrease in the value of demersal and pelagic species. The real terms value of demersal landings decreased by seven per cent and pelagic landings decreased by five per cent compared to 2018, whereas shellfish landings increased 10 per cent.

The 12 per cent fall in tonnage landed by Scottish vessels is attributed to falls in landings of pelagic fish and demersal fish. Pelagic landings fell 18 per cent by tonnage and demersal landings fell 11 per cent. Shellfish landings increased 17 per cent.

Table A. Change in total tonnage and value of landings by Scottish vessels between 2019 and 2018^{1,2}

	Tonnage 2019	Change from 2018	Value (£000) 2019	Change from 2018
Demersal	96,051	-11%	190,850	-7%
Haddock	27,199	-6%	41,285	-4%
Cod	14,549	-21%	40,797	-8%
Monkfish	10,701	-16%	34,178	-13%
All other demersal	43,603	-8%	74,589	-4%
Pelagic	234,457	-18%	195,228	-5%
Mackerel	127,628	-16%	158,128	-5%
Herring	49,433	-24%	26,049	5%
All other pelagic	57,396	-15%	11,052	-21%
Shellfish	62,217	17%	196,079	10%
<i>Nephrops</i>	24,080	33%	86,028	23%
Scallops	15,019	-2%	35,728	-11%
All other shellfish	23,118	17%	74,323	8%
TOTAL	392,726	-12%	582,158	-1%

As shown in Chart 2, in 2019 pelagic species represented 60 per cent by tonnage (234 thousand tonnes) and just over one third of value (£195 million). Demersal species represented nearly a quarter of the tonnage of all landings (96 thousand tonnes) and one third of the value (£191 million). Shellfish landings accounted for 16 per cent of tonnage (62 thousand tonnes) and 34 per cent by value (£196 million). This highlights the general difference in prices: Shellfish and demersal species generally tend to attract higher prices per tonne than pelagic species.

¹ Overall values are given in nominal terms in 2019, but percentage changes reflect real changes after adjusting for inflation.

² Values may not sum to their respective totals due to rounding.

Chart 2. Percentage of Scottish vessels' landings by species type in 2019

Pelagic species

Mackerel remained the most valuable species with £158 million, accounting for 27 per cent of the total value of Scottish landings. In 2019 the real value of mackerel landings fell five per cent and tonnage decreased by 16 per cent in line with a reduction in available quota. The real terms value of herring increased by five per cent and tonnage landed decreased 24 per cent since 2018.

Over the ten years 2010-2019, the tonnage of pelagic landings has increased by nearly one quarter (24 per cent) with real terms value rising by 29 per cent.

Demersal species

Scotland has a mixed demersal fishery which includes more than a dozen species with landings that are worth £1 million or more annually (Table 5 on page 53). Most demersal species decreased in real terms value compared to 2018 with a modest increase in the value of saithe and whiting. The real terms value of wrasses increased 81 per cent. The top three demersal species by value are haddock, cod and monkfish (anglerfish). Haddock became the most valuable demersal species and represented seven per cent of the total value of Scottish vessels' landings and 22 per cent of the value of demersal landings in 2019. Cod accounted for seven per cent of the value of Scottish vessels' landings and 21 per cent of demersal landings in 2019. Monkfish accounted for six per cent of the total value of Scottish vessels' landings and 18 per cent of the value of demersal landings in 2019.

Haddock landings fell in real terms value by four per cent but became the most valuable demersal species at just over £41 million. The real terms value of cod was down eight per cent to just under £41 million and monkfish fell 13 per cent to £34 million.

Compared to 2010, demersal landings fell nine per cent with real terms value increasing by seven per cent.

Chart 3. Tonnage of landings by Scottish vessels by species type 2010 to 2019

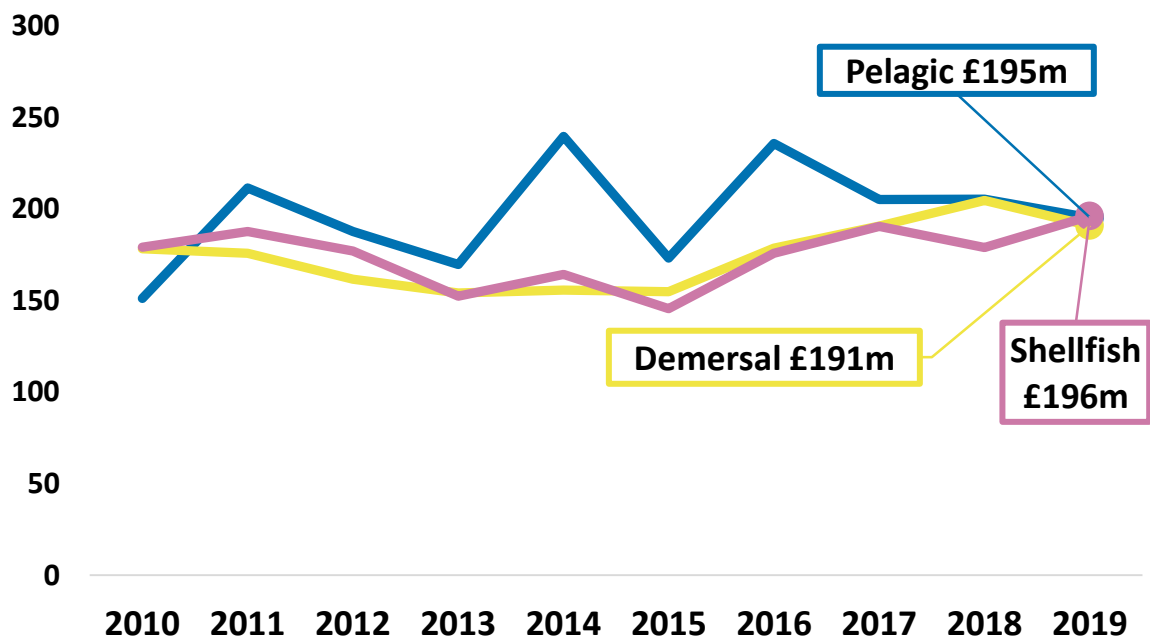

Chart 4. Real terms value of landings by Scottish vessels by species type 2010 to 2019

Shellfish species

Nephrops are the most valuable shellfish stock and the only shellfish species subject to quota. The Scottish fleet fish for *Nephrops* by creeling and by trawling. Creeled *Nephrops* are often caught and exported live. Creeled *Nephrops* typically represent a smaller tonnage of landings attracting a price per tonne more than three times that of trawled *Nephrops*. The average price per tonne of creeled *Nephrops* was £11,706 per tonne while for trawled *Nephrops* the average price was £3,081 per tonne. In 2019, 1,373 tonnes of creeled *Nephrops* were landed by the Scottish fleet with a value of £16 million³. 23 thousand tonnes of trawled *Nephrops* were landed worth £70 million⁴. These data are presented in Table 27 on page 77.

Scallops contribute 6% to overall value landed by Scottish vessels, with £36 million worth being landed in 2019. Edible crabs, velvet swim crabs and lobsters make up a small proportion of overall value landed by Scottish vessels (eight per cent combined) but are important for Scotland's large inshore fleet. Tonnage of edible crabs increased from 2018 by nine per cent to 11 thousand tonnes and the value in real terms decreased by two per cent to just under £25 million. Tonnage of lobsters increased by 2% from 2018 to 1,234 tonnes and the value in real terms remained consistent at £18 million.

Over the period 2010 to 2019, shellfish landings have fallen by 14 per cent while real terms value has risen nine per cent, reflecting growth in shellfish prices. This is in spite of the value of *Nephrops* falling by four per cent over the same period.

³ There is a small discrepancy between the values presented in Table 5. Scottish vessels' landings anywhere and Table 27. Scottish vessels' landings by gear type, which happens because a significant amount of *Nephrops* is caught by demersal gear types. Other species may also be effected by this.

⁴ This publication always reports tonnages in *live weight equivalent*, so *Nephrops* landed as 'tails' are multiplied by a standardised conversion factor so that they are made comparable to *Nephrops* landed whole.

Chart 5. Trend in tonnage of key species (value of £20 million or over) landed by Scottish vessels 2010 to 2019

Chart 6. Trend in real value of key species (value of £20 million or over) landed by Scottish vessels 2010 to 2019

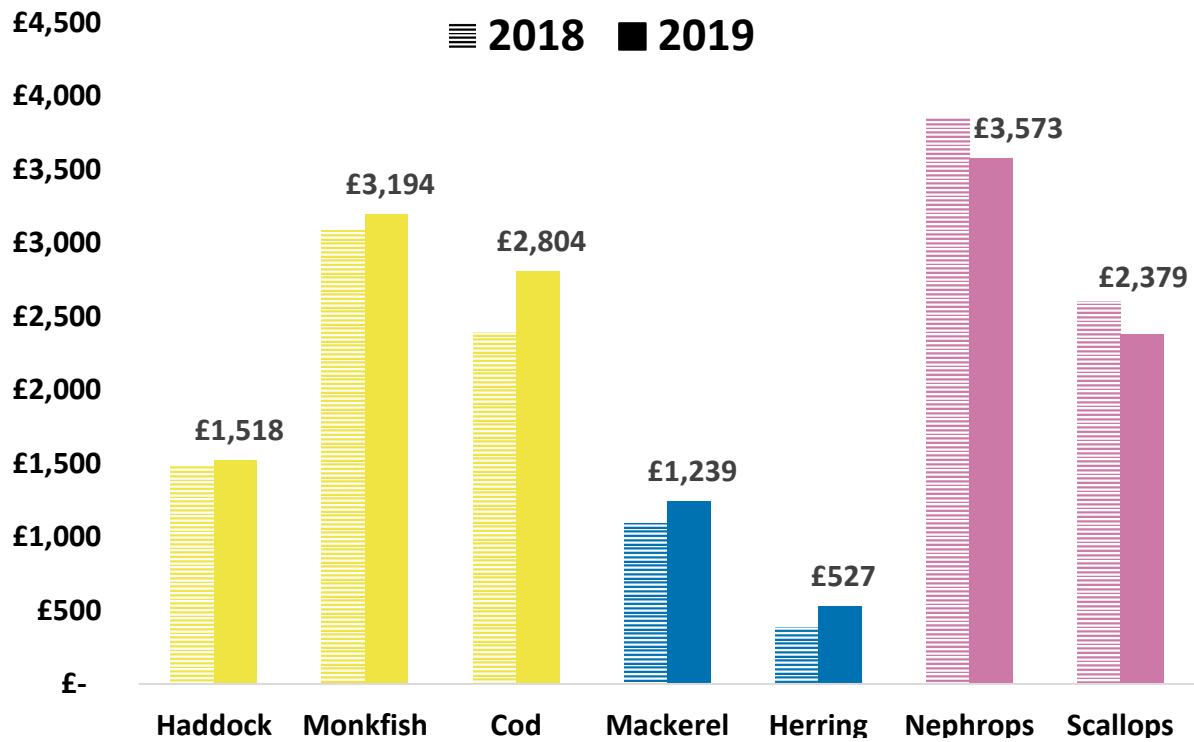

Chart 7. Real terms price per tonne for key species (value of £20 million or over landed by Scottish vessels) 2018 and 2019

The price per tonne for each species is presented in Table 23 on page 72 for the period 2015 to 2019.

3.2. Landings abroad by Scottish vessels

In 2019, Scottish vessels landed 148 thousand tonnes of sea fish and shellfish worth £124 million abroad. The tonnage landed abroad decreased by seven per cent and the real terms value of landings abroad remained consistent with 2018 (Table 4 on page 52). Landings abroad accounted for 38 per cent of all landings by Scottish vessels by tonnage and 21 per cent by value. Of this, 95 per cent of the tonnage landed abroad was pelagic, three per cent was demersal and two per cent was shellfish.

The main species landed abroad was mackerel, representing 72 per cent of the total value of fish landed abroad in 2019. Since 2018, mackerel landings abroad have fallen in tonnage by eight per cent and increased in real terms value by two per cent. There were 71 thousand tonnes of mackerel worth £89 million landed abroad, which is 56 per cent of the total tonnage and 56 per cent the value of mackerel landed by Scottish vessels. The price for both mackerel landed into the UK and mackerel landed abroad in 2019 was an average of £1,239 per tonne.

Norway is by far the largest destination for Scottish vessels' landings abroad, accounting for 51 per cent by tonnage and 65 per cent by value of all Scottish vessels' landings abroad. Landings into Norway fell 19 per cent by tonnage compared to 2018 and the real terms value of these landings have fallen by seven per cent (Table 25 on page 74). The fall in tonnage of mackerel landings into Norway is consistent with the fall in overall tonnage of landings of mackerel by Scottish vessels. Nearly all Scottish landings into Norway were of pelagic species.

In 2019, 86 per cent of the value of landings into Norway was for mackerel, amounting to 55 thousand tonnes with a value of £69 million.

Key countries for demersal landings were the Netherlands, Spain and Ireland. Scottish vessels landed five thousand tonnes of demersal species abroad with a value of £8 million.

There was 2,743 tonnes of shellfish landed abroad by Scottish vessels in 2019, an increase of 191% on 2018. These were mainly into Ireland, the Netherlands and France.

Chart 8. Percentage of tonnage and value landed abroad by Scottish vessels by species type in 2019

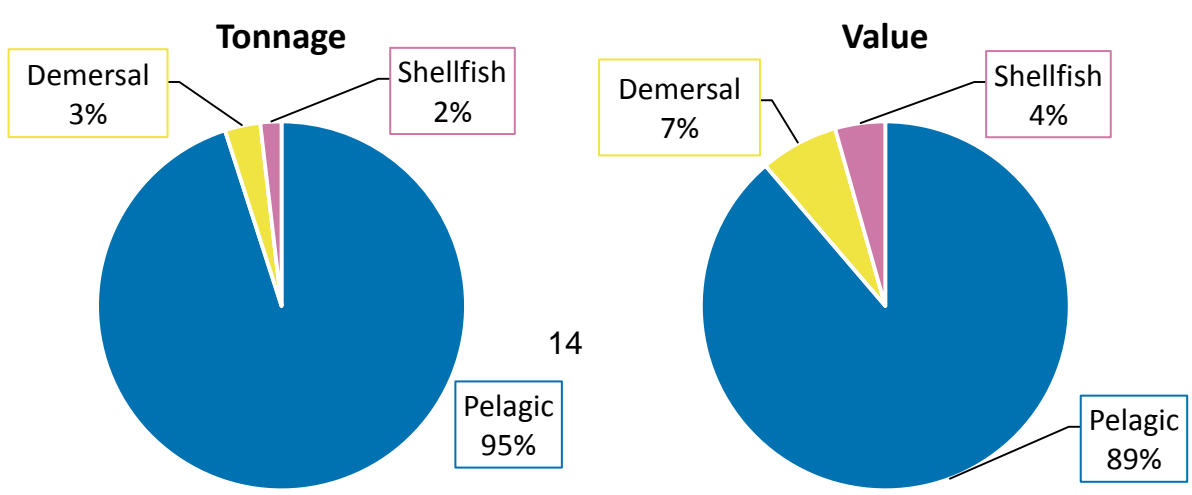

Figure 2. Tonnage landed abroad by Scottish vessels by country of landing and species type in 2019

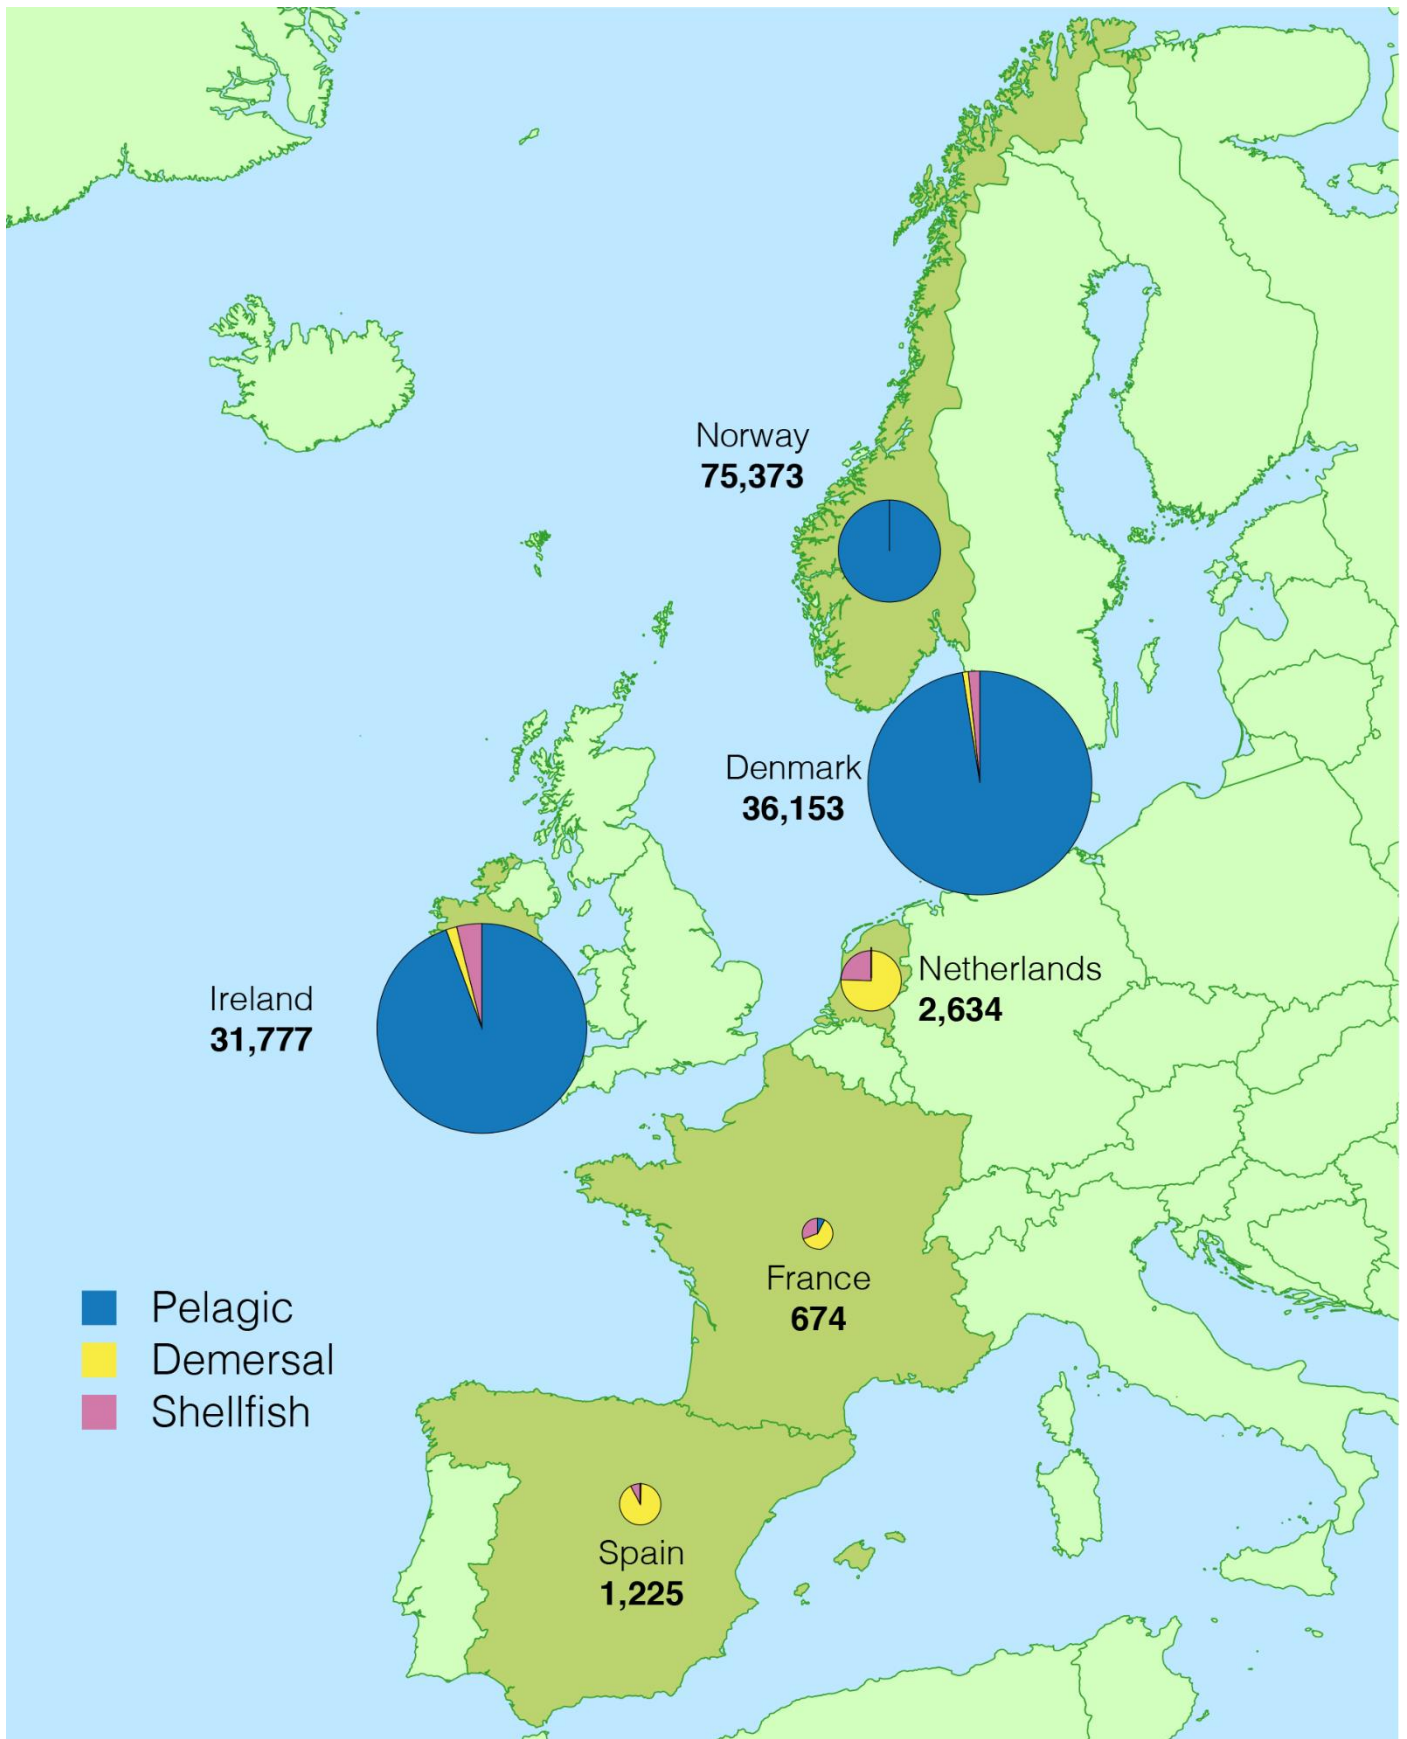

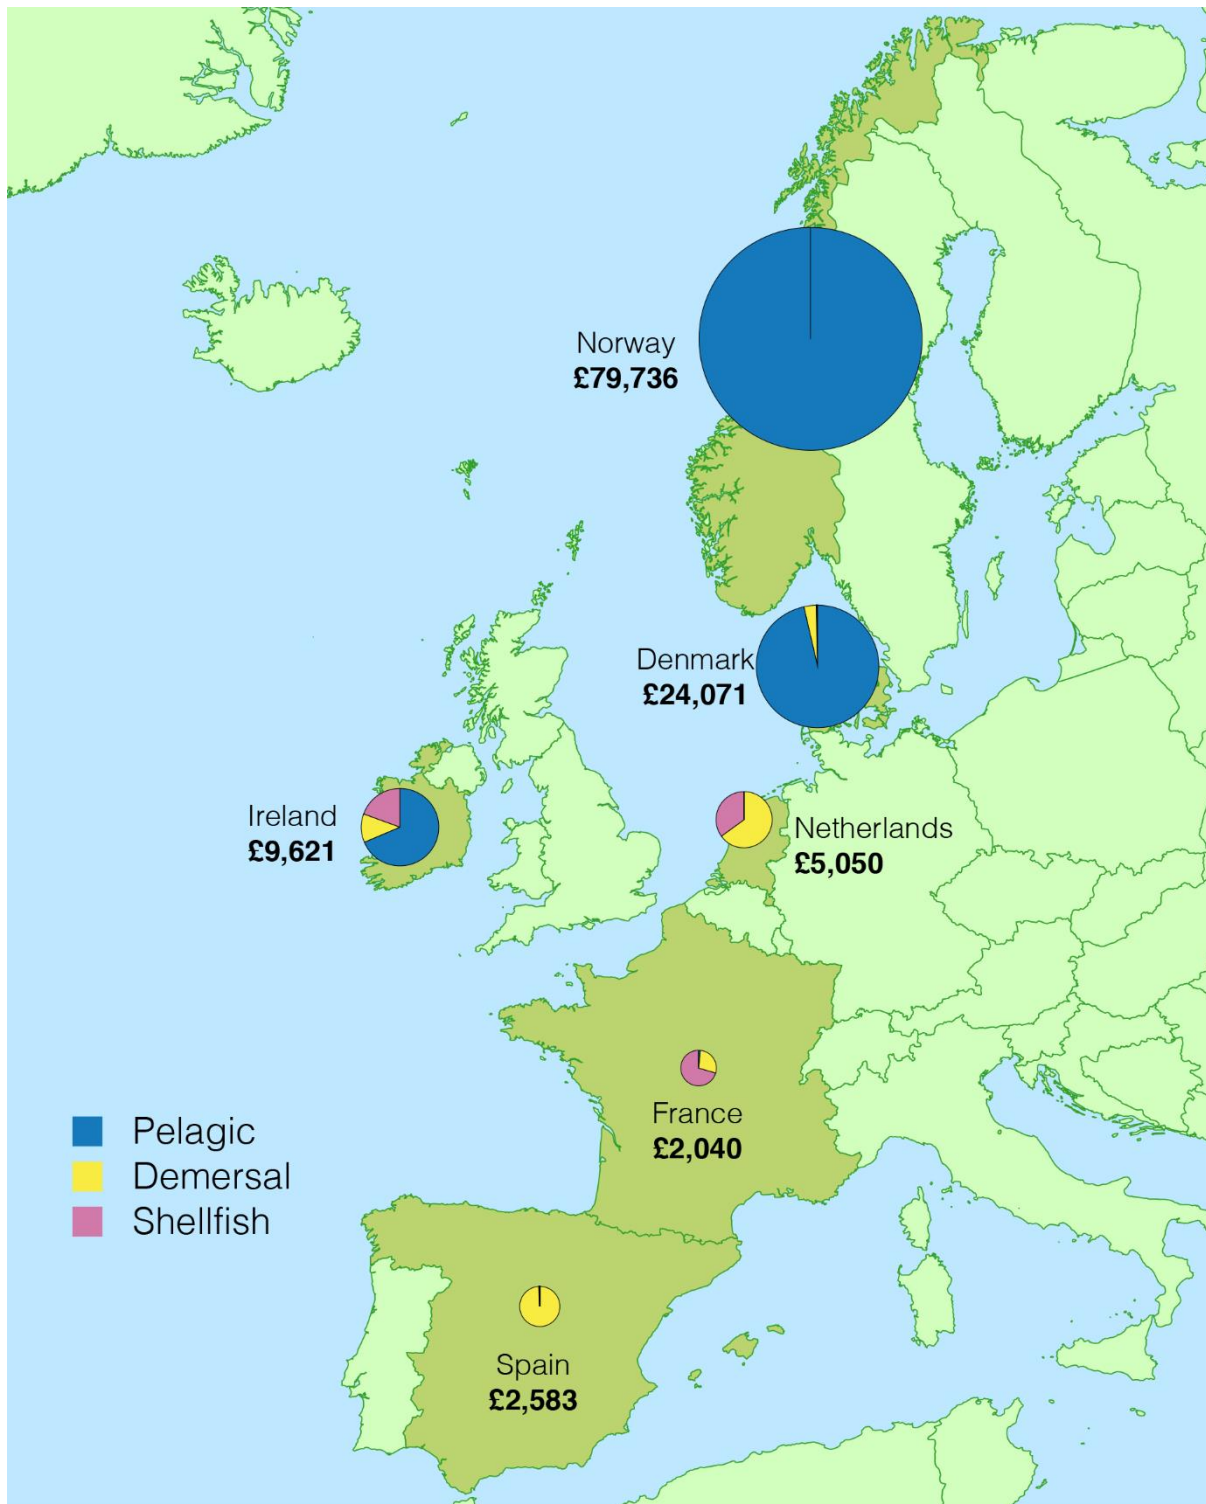

Figure 3. Value of landings (£' thousands) abroad by Scottish vessels by country of landing and species type in 2019

3.3. Landings by area of capture

Scottish vessels are most active in two main ICES Rectangles⁵: the Northern North Sea (ICES Area IVa) and the West Coast of Scotland (ICES Area VIa) (0 and 0). 220 thousand tonnes of sea fish and shellfish with a value of £328 million were landed from the Northern North Sea, representing 56 per cent of the tonnage and 56 per cent of the value of all landings by Scottish vessels (Table 28 on page 79). Just over one fifth (22 per cent) of landings by Scottish vessels by tonnage were caught in the West Coast of Scotland (VIa), providing a little over one quarter (26 per cent) of the total value of all Scottish landings. Area VII (excluding the Irish Sea) accounted for 9 per cent of the tonnage of all landings and five per cent of value.

By species type, 68 per cent of the tonnage of all demersal landings by Scottish vessels was caught in the Northern North Sea (IVa), and 15% in the West Coast of Scotland (VIa). For pelagic landings, 58 per cent by tonnage were caught in the Northern North Sea (IVa) and 24 per cent were caught in the West Coast of Scotland (VIa).

Contrary to 2018, a higher tonnage of shellfish species was caught in the Northern North Sea than in the West of Scotland (Area VIa). The Central North Sea (ICES Area IVb) and area VII (excluding the Irish Sea) are also areas of considerable activity for shellfish fisheries. By tonnage, shellfish catches from the Northern North Sea (IVa) accounted for 32 per cent of all shellfish landings and 28 per cent of shellfish landings were caught in the West of Scotland. 19 per cent of shellfish catches were from the Central North Sea (IVb), 13 per cent in area VII (excluding the Irish Sea) and seven per cent were from the Irish Sea (VIIa). Almost all landings from the Irish Sea were of shellfish species.

Further data on fishing activity in the seas around the UK by Scottish vessels, other UK vessels and foreign vessels that land into the UK are available by ICES rectangle on the Scottish Sea Fisheries Statistics website (see Annex 3 on page 46). These data show the tonnage and value of landings by species type and fishing effort by ICES rectangle. Maps on fishing activity in Scottish waters by Scottish vessels, other UK vessels, and foreign vessels that land into the UK are available on the National Marine Plan Interactive (NMPi) webpage.

⁵ ICES is the International Council for the Exploration of the Sea.

Figure 4. Tonnage landed by Scottish vessels by area of capture and species type in 2019

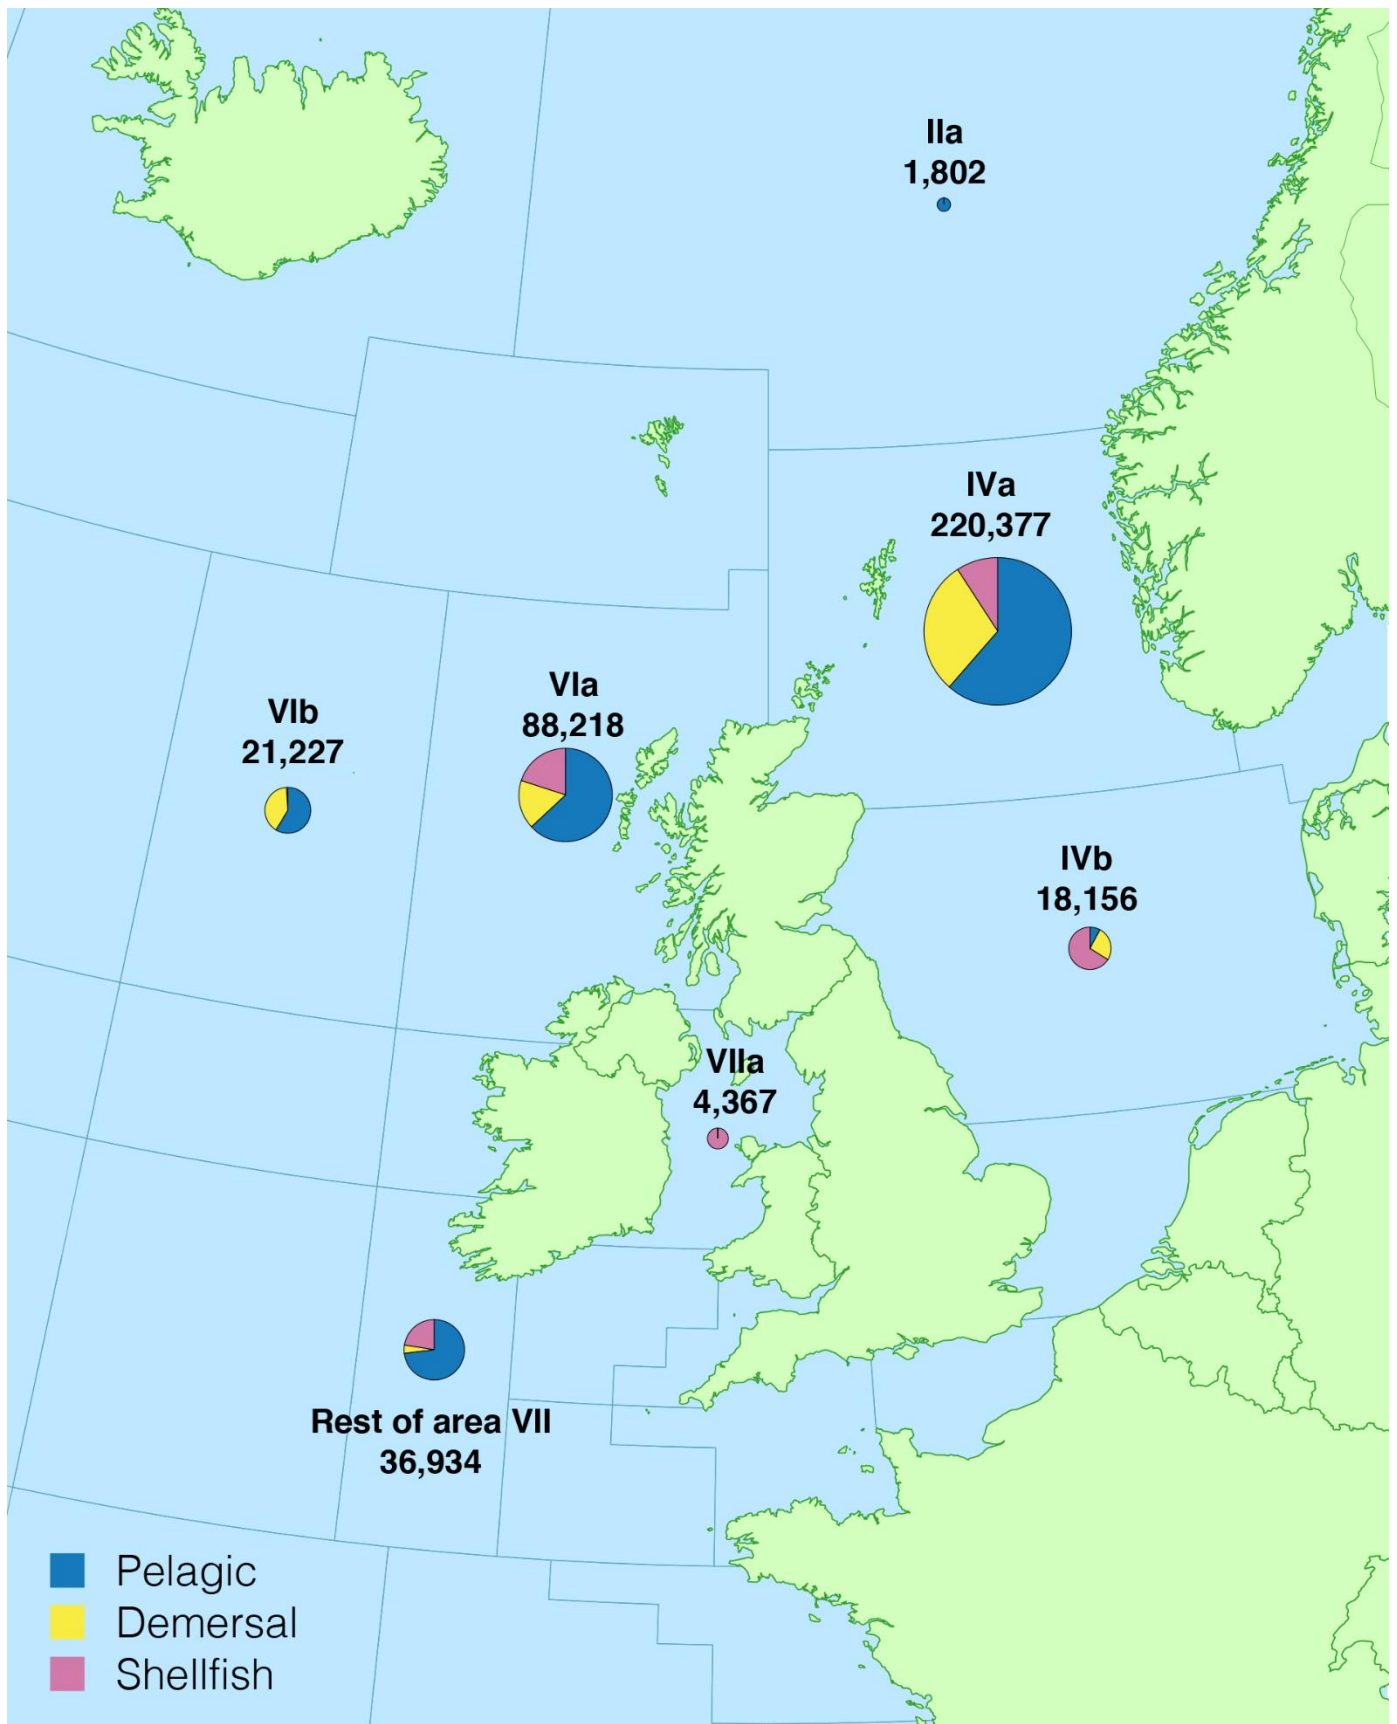

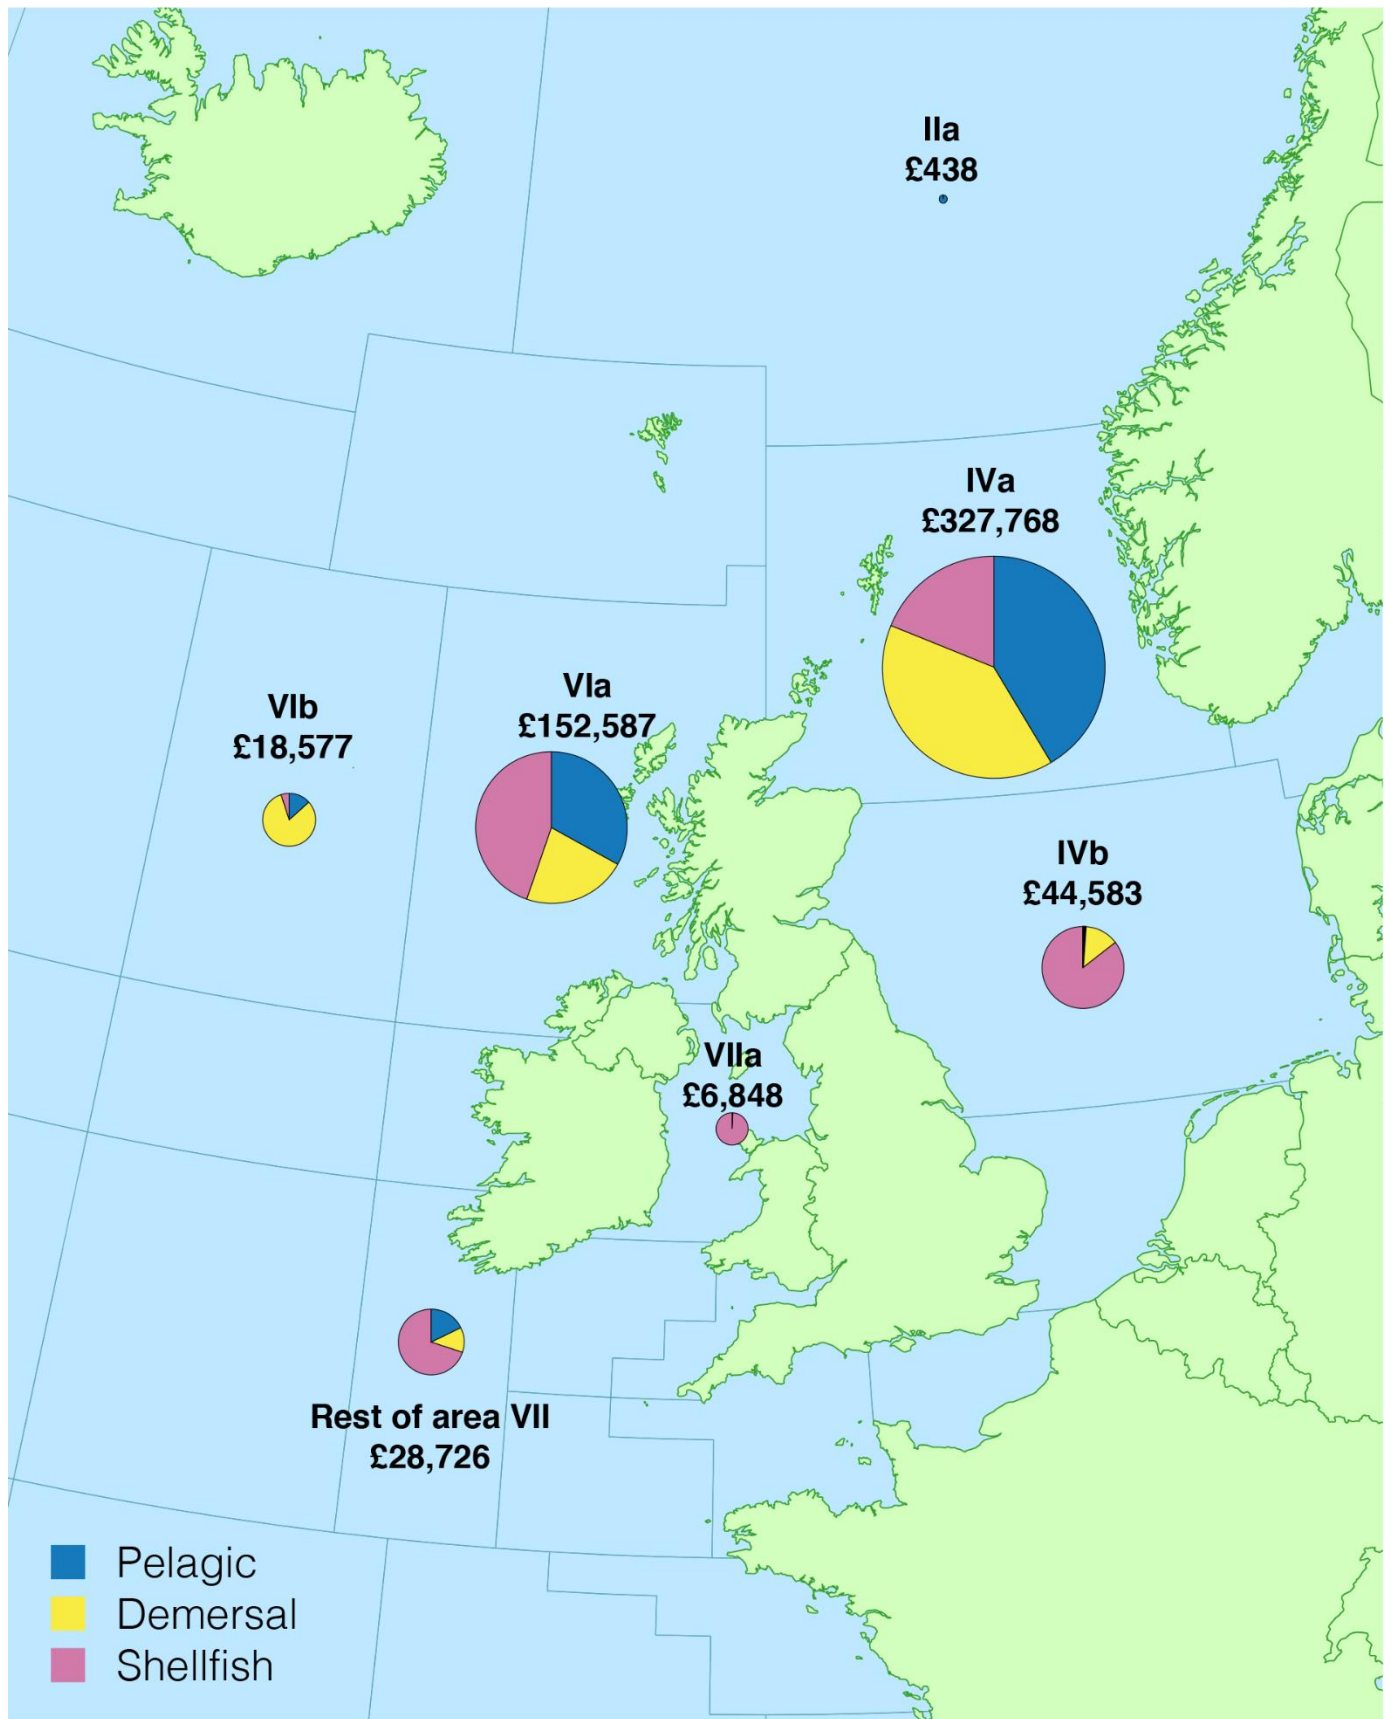

Figure 5. Value of landings (£'thousands) by Scottish vessels by area of capture and species type in 2019

3.4. All landings into Scotland

In 2019, 300 thousand tonnes of sea fish and shellfish with a value of £523 million were landed into Scotland. This represents a 14 per cent decrease in tonnage and a two per cent decrease in real terms value from 2018. Landings of demersal species accounted for 45 per cent, pelagic species 38 per cent and shellfish species 17 per cent of the total tonnage landed into Scotland. By value, almost half (48 per cent) of landings into Scotland were demersal species, 20 per cent were pelagic and 33 per cent were shellfish species⁶. The differences in shares by tonnage and value reflect the differences in average prices per tonne (for landings by Scottish vessels) across the species types: shellfish sell at relatively higher average prices per tonne, whilst pelagic species receive the lowest average prices per tonne (Table 23 on page 72).

Figure 6 and 7 show landings by all vessels by species type into the eighteen Scottish port districts (also in Table 29 on page 80). Landings into the south-west coast and south-east coast were dominated by shellfish, while landings into the north-west coast were mostly demersal and the north-east coast were mostly pelagic landings. The top three districts in Scotland by total tonnage landed were Peterhead (east coast), Shetland (north) and Fraserburgh (east coast). Peterhead is the single largest fishing port in the UK by tonnage and value of landings.

Combined, the top three districts for tonnage accounted for 73 per cent of total weight landed and 59 per cent of value of all landings into Scotland. Peterhead had 147 thousand tonnes landed in 2019 with a value of £184 million. This represents a 14 per cent decrease in tonnage and a two per cent decrease in real terms value from 2018. By tonnage, just under three-fifths (57 per cent) of the landings into Peterhead comprised pelagic species and these accounted for almost two-fifths (39 per cent) of the landings value into the district. In contrast, 39 per cent of the tonnage landed into Peterhead was demersal species that accounted for 51 per cent of the value.

Landings into Shetland totalled 50 thousand tonnes (down 26 per cent from 2018) and were valued at £81 million (down nine per cent). As with Peterhead, the majority of landings into Shetland by tonnage were of pelagic species, which represented 48 per cent of the total tonnage landed and 28 per cent of the total value of landings. Demersal species accounted for 47 per cent of the tonnage and almost two thirds (63 per cent) of the value landed into Shetland.

Landings into Fraserburgh totalled 21 thousand tonnes worth £46 million. The largest landings were Shellfish species, which represented over two-fifths (41 per cent) of the tonnage landed and 60 per cent of the total value of landings. Demersal species accounted for 33 per cent of the tonnage and a quarter (25 per cent) of the value landed into Fraserburgh, with pelagic species making up 26 per cent of the tonnage and 15 per cent of the value.

The largest percentage fall in tonnage landed was into Shetland (26 per cent fall) due to lower landings of mackerel and herring into the district compared to 2018.

⁶ The values here do not sum up to 100 per cent due to rounding.

The largest percentage rise in tonnage was into Mallaig (up 49 per cent) due to increased landings of sprats. This is following the absence of any sprat landings into Mallaig in 2018, due to none appearing in the Minch area.

Figure 6. Tonnage landed into Scotland by all vessels by district and species type in 2019

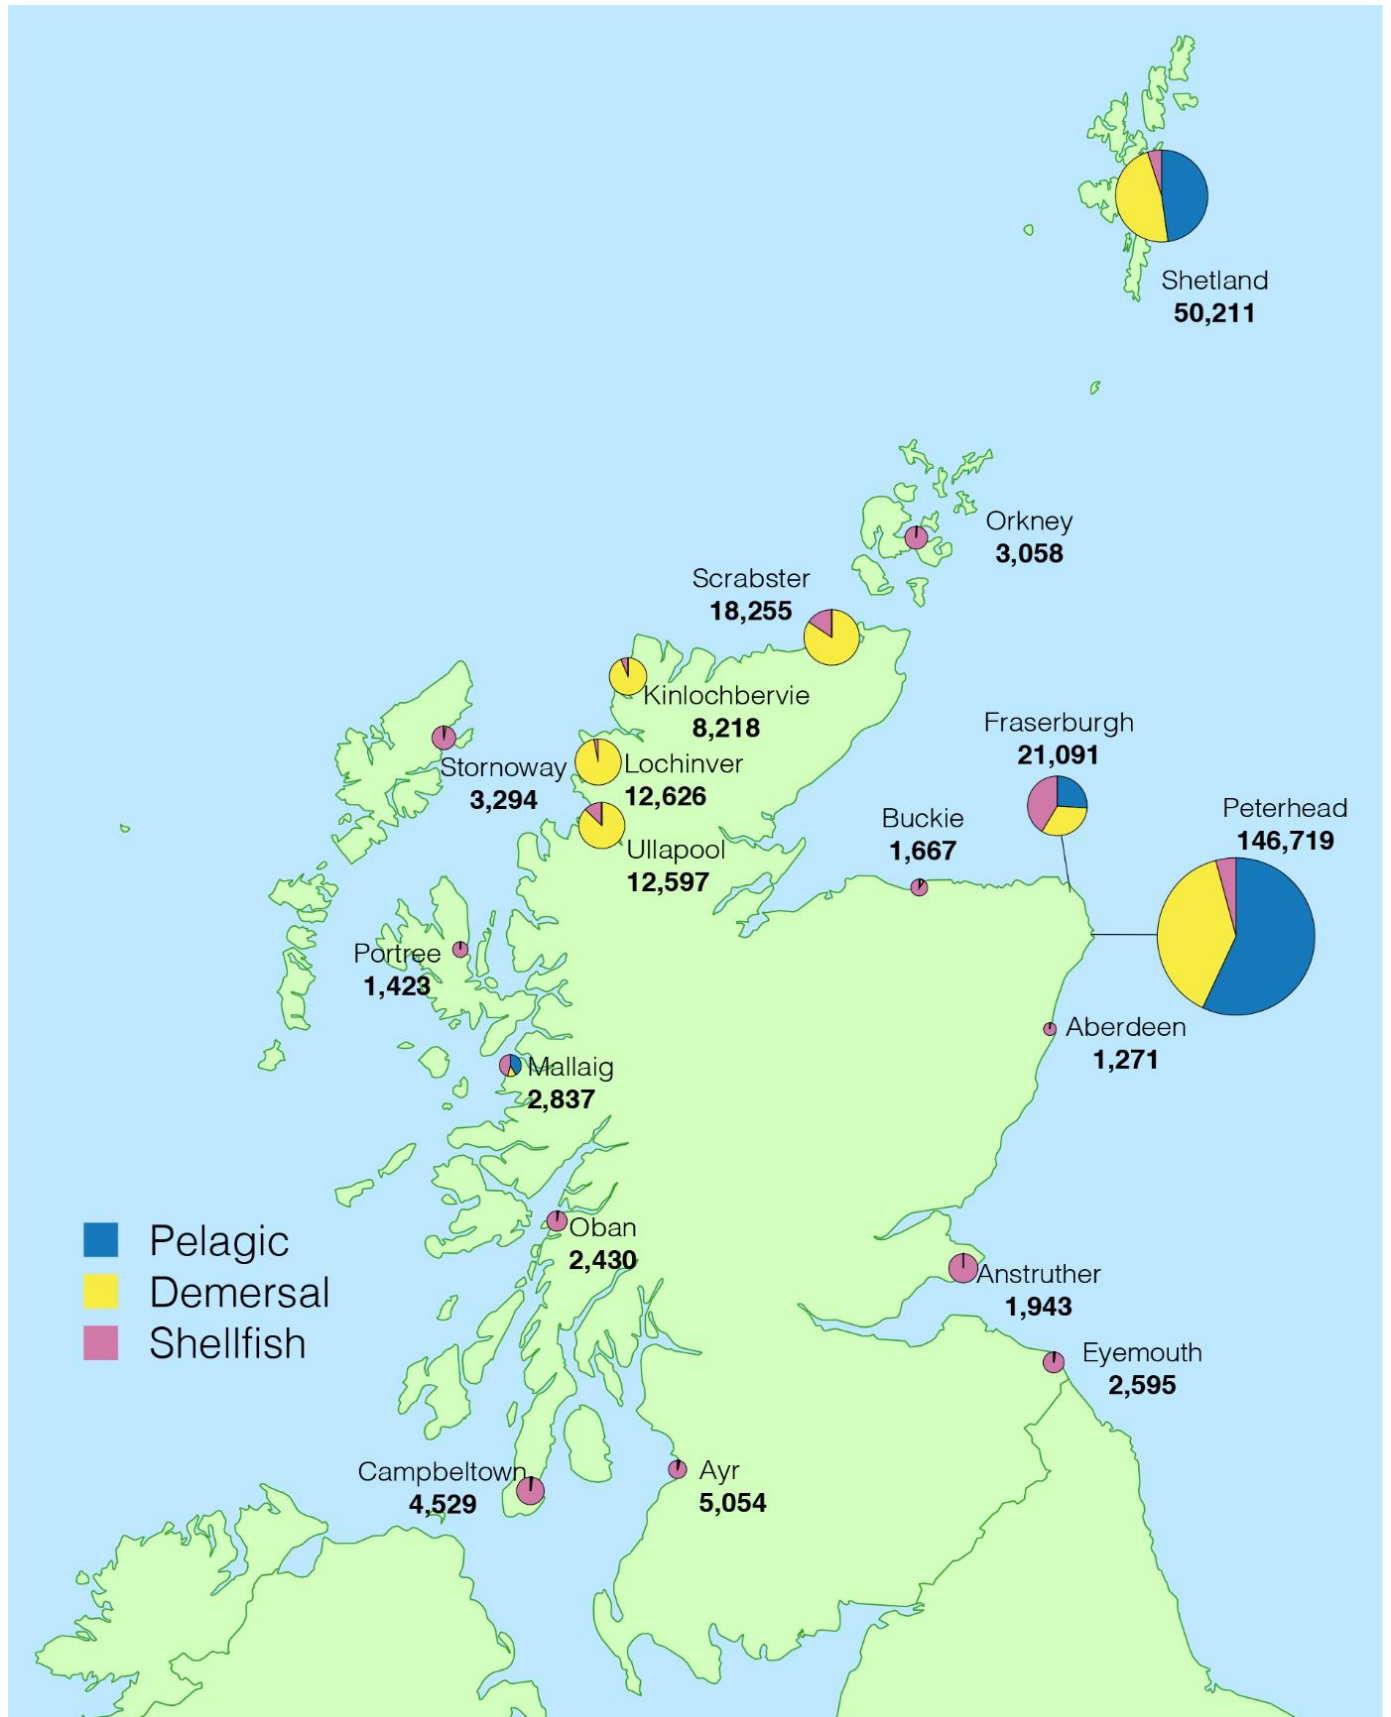

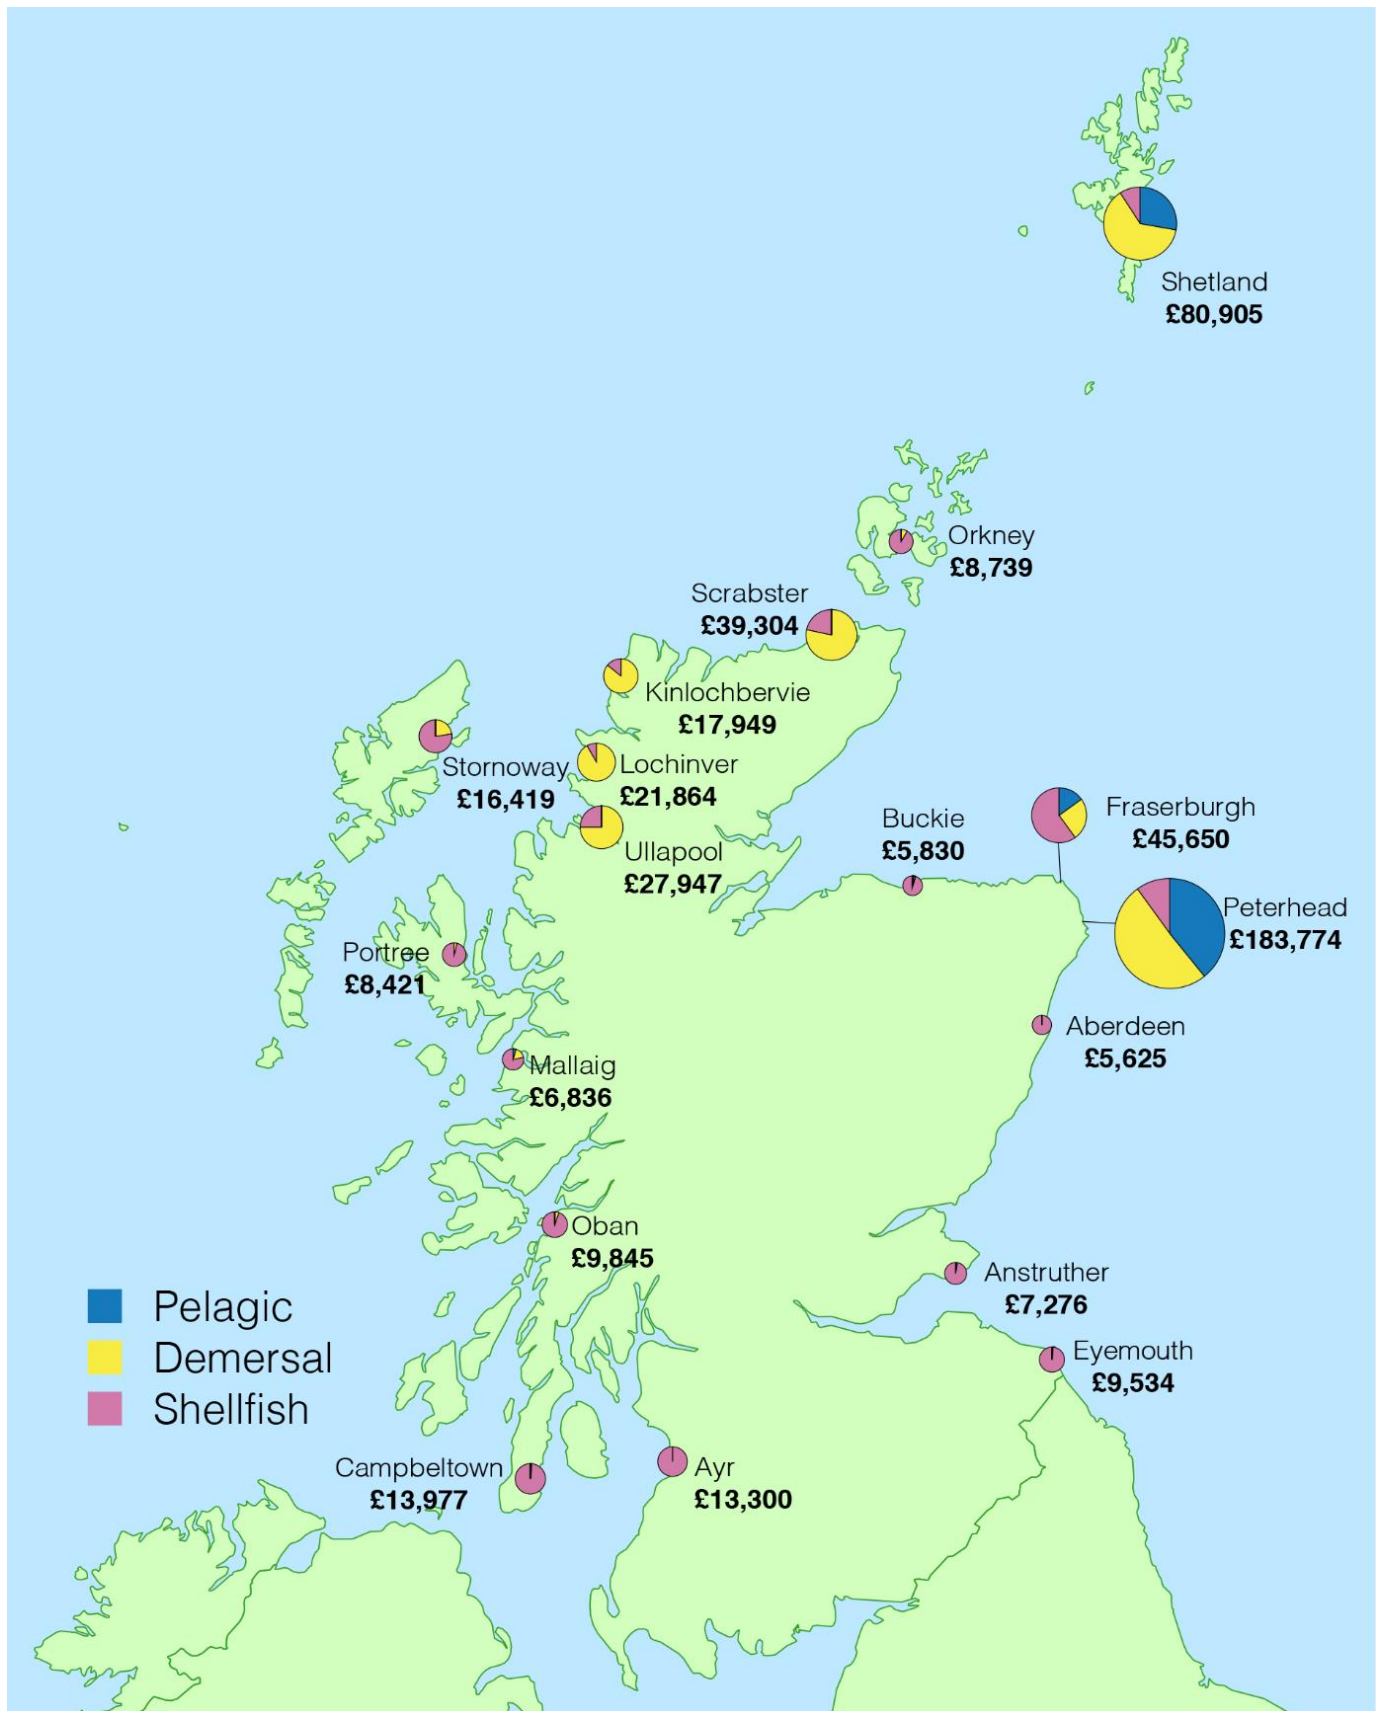

Figure 7. Value of landings (£'thousands) into Scotland by all vessels by district by species type in 2019

3.5. Total Allowable Catches quota and uptake

Total Allowable Catches (TAC) are limits set at annual international negotiations for individual fish stocks and represent the maximum of each fish stock that can be caught. Some stocks are managed and fished only by European Union (EU) member states. The TACs for these stocks are set by the European Commission through internal negotiations between EU member states with an interest and based on independent scientific advice from ICES. Other stocks are managed and shared with non-EU states and TACs for these are set at separate negotiations with the 'Coastal States': Norway, Iceland, the Faroe Islands and Russia. The EU TAC is shared among EU member states based on a number of factors, including each member state's past catch record. The amounts corresponding to this share, known as quotas, are shown at the UK and at the Scottish Producers Organisations' (POs) level in Table 33 on page 93. Uptake of key commercial quota stocks by all Scottish vessels by tonnage and value landed are presented in Table 34 on page 103.

Chart 9 **compares the quota uptake of key quota stocks** (with landings by Scottish vessels in excess of £20 million) for Scottish POs in the North Sea and West Coast, in 2019. In general, Scottish POs had high quota uptake in 2019 for key demersal and pelagic species. Mackerel and herring stocks in both the West of Scotland and the North Sea exceeded quota.⁷ West of Scotland cod has a nil quota and is managed as a bycatch.

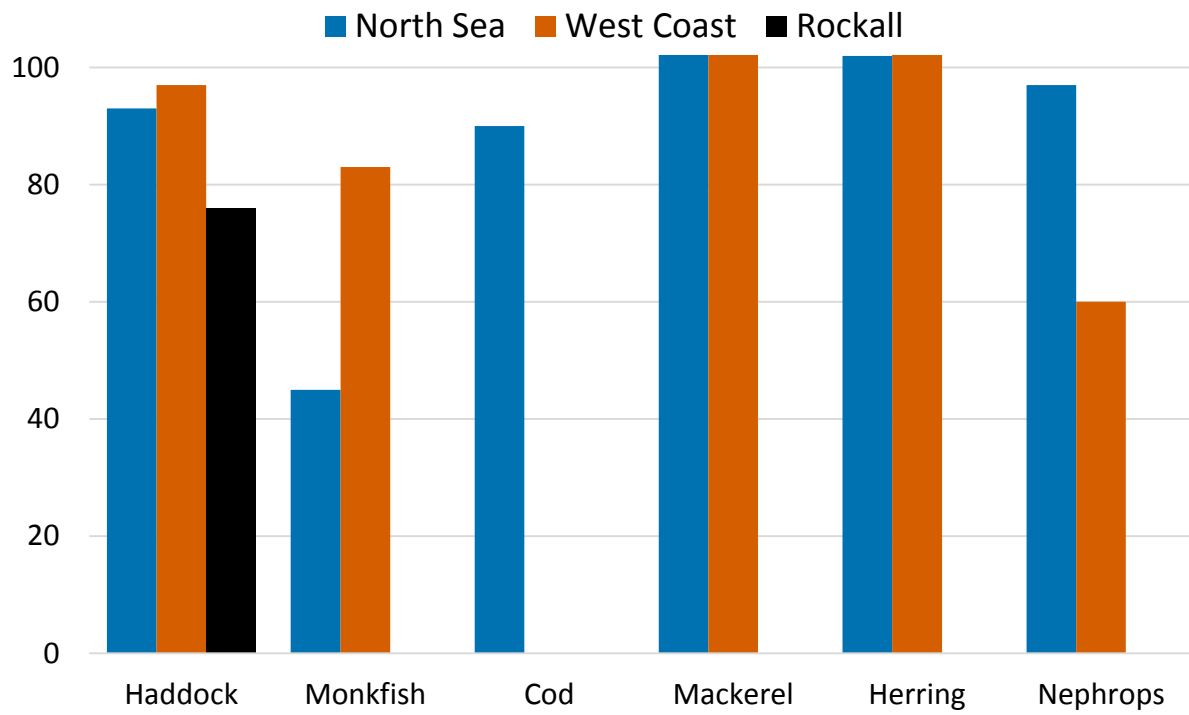

For **demersal stocks**, uptake in the North Sea was generally high with cod quota uptake at 90% and haddock at 93%. Uptake of plaice, megrim and sole was lower (35 – 59%). In the West Coast, demersal uptake was slightly more varied for each species than the North Sea. Of the three haddock stocks, all were above 75 per cent uptake. Monkfish uptake reached 83 per cent in the West Coast but was low in the North Sea at 45 per cent.

Pelagic species have consistently high quota uptake for both the West Coast and North Sea. Mackerel quota uptake was 107 per cent for both the West Coast and the North Sea. This is five percentage points up on 2018 for the West Coast and eight percentage points up for the North Sea. For herring, West Coast uptake was at 108 per cent and North Sea uptake was 102 per cent.

The only **shellfish species** subject to quota is *Nephrops*. In 2019, Scottish PO quota uptake for North Sea *Nephrops* was 97 per cent and for West Coast *Nephrops* it was 60 per cent. This is 45 percentage points up compared to 2018 for the North Sea and 11 percentage points down for the West Coast.

⁷ Landings can exceed quota if POs or vessels 'carry over' some quota from a previous year into the next year. This can only be done within agreed limits. There is also an allowance so that a country can exceed up to ten per cent of its quota on a particular stock and the excess is deducted from the following year's quota allocation.

Chart 9. Percentage quota uptakes of key commercial stocks by vessels in Scottish Producer Organisations in 2019

4. The Scottish fishing fleet

4.1. Regulation of the UK fleet

UK fishing vessels are required by law to be registered with the Registry of Shipping and Seamen (RSS), part of the Maritime and Coastguard Agency. Fishing vessels must also have a licence that specifies conditions that must be adhered to. For the purpose of this publication, active vessels are those that are both registered and licensed as at 31st December of that year. Scottish based vessels are those registered to a port in Scotland licensed and administered by a Scottish district (see the map on page 112). UK fishing vessel licences authorise the sea areas in which a vessel can fish and the species of fish that can be caught.

The capacity of fishing vessels in terms of vessel tonnage and engine power is also controlled through licences. With a finite number of licences in existence and no new licences made available, this places a ceiling on the total number and capacity of vessels in the UK fishing fleet. In order to licence new vessels, fishers must acquire existing licences from other previously licensed vessels.

4.2. The Scottish fishing fleet

The number of active Scottish based vessels has increased to 2,098 vessels in 2019, an increase of 9 vessels since 2018 and a two per cent decrease (44 vessels) since 2010 (Table 35 on page 104). The Scottish fleet is dominated by vessels that are ten metres and under in length with a total of 1,559 vessels falling into this category in 2019, accounting for 74 per cent of the Scottish fleet. 539 vessels are over ten metres in length.

Compared to 2010, the ten metre and under fleet has increased by 80 vessels (five per cent) while the over ten metre fleet has decreased by 124 vessels (19 per cent).

Around one quarter of vessels (24 per cent, 504 vessels) in the Scottish fleet are of unknown age. Of those that are known, 477 (30 per cent) are under 20 years old, with an overall average age of 28 years (Table 36 on page 105 and Chart 10).

Chart 10. Number of Scottish vessels by age group

Table 37 on page 106 shows the number of vessels in each of the eighteen administration districts in Scotland. Fraserburgh is the district with the highest number of vessels with 223 vessels (11 per cent of the Scottish fleet) . This was closely followed by Shetland (221) and Stornoway (219) districts. A little over half (56 per cent) of the vessels in the Fraserburgh district were in the ten metre and under category, whereas for Stornoway and Shetland districts this was just over four-fifths of the vessels there. Lochinver is the only district to have more over ten metre vessels (64 per cent) than ten metre and under vessels. In the over ten metre fleet, there are more vessels targeting shellfish on the West coast than in the islands or East coast, whereas demersal and pelagic vessels are concentrated on the East coast.

The total engine power of the Scottish fleet has remained broadly consistent at 365 thousand kW (up 2,707 kW, one per cent change since 2018). The total power of the over ten metre fleet remained stable at 276 thousand kW and the total power of the ten metre and under fleet increased three per cent to 89 thousand kW (Chart 11). The average power for the over ten metre fleet was 512 kW per vessel in 2019, whereas the ten metre and under vessels had an average power of 57 kW per vessel.

Compared to 2010, average power has seen change in the ten metre and under fleet and the over ten metre fleet, with an increase of seven per cent in the ten metre and under fleet and an increase of six per cent in the over 10m fleet.

Chart 11. Scottish vessel engine power in megawatts by length group
2010 to 2019

5. Employment

In 2019, 4,886 fishers were working on Scottish based vessels, representing 0.2 per cent of the total Scottish labour force⁸. The number of fishers working on Scottish vessels rose by one per cent (up 26) between 2018 and 2019 (Table 41 on page 110 and Chart 12). In addition to regular and irregular (formerly described as part time) fishers⁹, Scotland has a small number of Crofters who engage in commercial fishing. There were 39 crofters in 2019 up from eight in 2018. There is some difficulty in classifying which fishers are crofters and crofters may choose to fish in some years but not in others.

Although employment in the fishing fleet is a small percentage of total employment in Scotland, employment in fishing accounts for a higher percentage of employment in island communities (Shetland four per cent, Na h-Eileanan Siar three per cent, Orkney two per cent) and in Argyll and Bute (one per cent) (Table 43 on page 111).

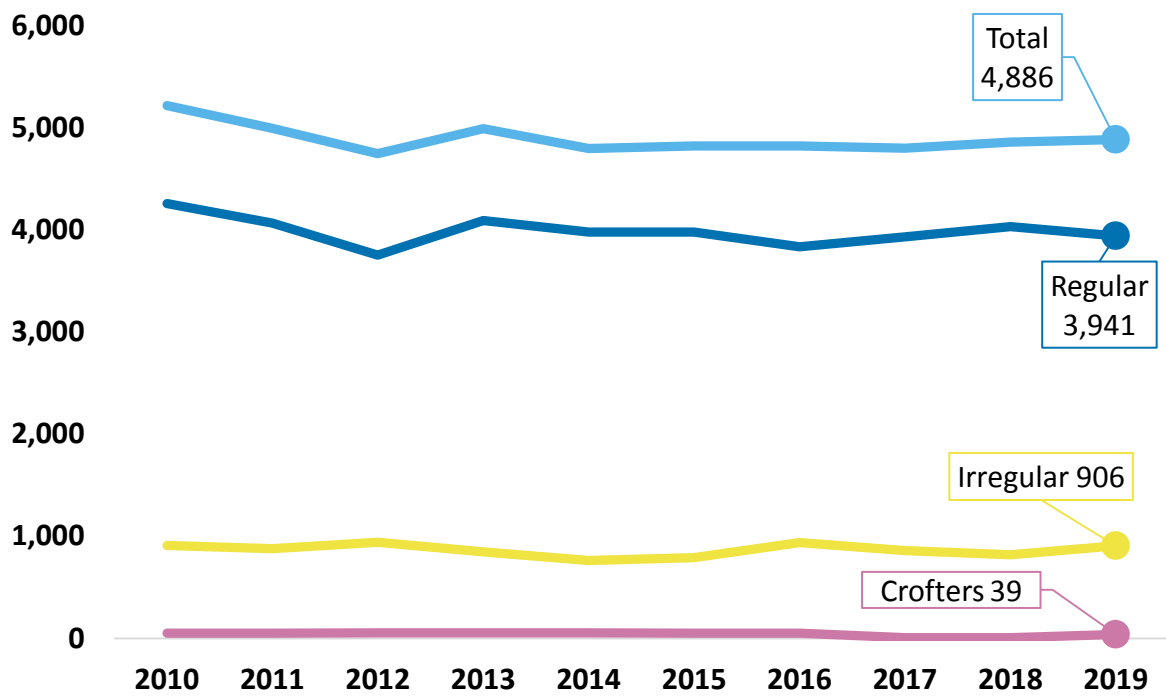

Since 2010, employment on Scottish based fishing vessels has fallen six per cent. This is composed of a seven per cent decrease in regular employment and a 25 per cent fall in the number of crofters.

Fraserburgh is the district with the largest number of fishers (797) accounting for 16 per cent of the total in 2019. It is also the district with the largest number of fishers who work regularly, with 788 regularly employed fishers. Shetland had the most irregular fishers (254), accounting for 28 per cent of the total fishers in this category. Stornoway was the district with the largest number of crofters employed (26), accounting for 67 per cent of the total fishers in this category.

⁸ Figures for the Scottish labour force come from the Annual Population Survey 2019 by ONS.

⁹ Regular and Irregular not does translate directly to full or part time. Fishers often work for a defined 'crew share', or percentage of the vessel's earnings, rather than a formal employment contract with specified working hours.

Chart 12. Number of fishers working on Scottish vessels 2010 to 2019

6. Scottish sea fisheries in comparison to other countries

6.1. Scottish registered vessels compared to the whole of the UK

Landings by Scottish vessels accounted for 62 per cent of the tonnage and 60 per cent of the value of all landings by UK vessels in 2019 (Table 22a, page 70). Compared to 2018, this Scottish share of the total UK value has increased by two percentage points and tonnage has decreased by one percentage point.

The Scottish fleet lands 59 per cent both by tonnage and by value of the UK's **demersal fish**. Across the top three demersal species by value, Scottish vessels landed high proportions of UK total landings. Scottish vessels landed 50 per cent of UK landings by tonnage and 77 per cent by value of cod. For haddock, Scottish landings accounted for 81 per cent by tonnage and 82 per cent by value. For monkfish, Scottish landings were 61 per cent by tonnage and 64 per cent by value. By comparison, the rest of the UK fleet landed the majority of species such as bass, brill, sole and turbot, showing that the Scottish fleet and rest of the UK fleet mostly fish for different species

Scottish vessels' landings account for 74 per cent by tonnage and 76 per cent by value of **pelagic fish** landings into the UK. This included four fifths of UK mackerel landings by tonnage and 83 per cent by value, and 66 per cent of herring landings and value.

Scottish vessels landed 42 per cent of the UK total tonnage and 50 per cent of the UK total value of **shellfish**. For key species, *Nephrops* landings by Scottish vessels were 74 per cent of the UK landings by value and 70 per cent by tonnage. Scallops landings were 59 per cent by tonnage and 61 per cent by value of UK landings. The proportions for crabs and lobsters are lower: for edible crabs, Scottish landings were 35 per cent by tonnage and 34 per cent by value of UK landings and for lobsters it was 37 per cent by tonnage and 38 per cent by value.

6.2. Landings into Scotland compared to all landings into the UK

Landings into Scotland were 68 per cent by tonnage and 64 per cent by value of all landings into the UK. This high percentage landed into Scotland applies to all fish landings into the UK across species groups. For demersal species, landings into Scotland represented 81 per cent of the tonnage and 74 per cent of the value. For pelagic landings it was 84 per cent of tonnage and 89 per cent of value and for shellfish landings it was 36 per cent of tonnage and 46 per cent of value.

The Marine Management Organisation produces a comparison of the UK fishing fleet (vessels) by home nation in UK Sea Fisheries Statistics (see Annex 3: Further Information on page 46).

6.3. Landings by Scottish vessels compared to landings by other European countries

Data on landings for the European Union¹⁰ are published by Eurostat and include all EU member states with sea fishing fleets as well as Iceland, Norway and Turkey. Data are available for 2018 for all but four member states¹¹. The EU fishing fleet in 2018 landed 5.4 million tonnes live weight equivalent, of which the UK fleet landed 697 thousand tonnes¹² (13 per cent). The UK landed the third-highest tonnage of fish, with Denmark and Spain first and second respectively. The Scottish fleet landed 445 thousand tonnes or eight per cent of the EU total, in 2018. If the Scottish fleet was counted separately from the rest of the UK fleet, it would be the fourth-highest tonnage of landings in the EU.

6.4. Scottish vessels compared to UK and European Union vessels

The total EU fishing fleet in 2018 was 81,860 vessels, of which 6,046¹³ vessels (7.4 per cent of the total) were registered in the UK. The Scottish fleet numbered 2,089 vessels or 2.6 per cent of the EU total. Compared to 2009, the EU fishing fleet decreased by 2.8 per cent, the UK fleet decreased by 7.7 per cent and the Scottish fleet decreased by 4 per cent.

¹⁰ In this 2019 edition of Scottish Sea Fisheries Statistics, the UK figures are included in the European Union totals for 2018. In future publications the UK figures will no longer be included in the EU figures.

¹¹ 2018 Catch data for Denmark, Ireland, Greece and Latvia are confidential, therefore the most recent catch data available for these countries has been used.

¹² The UK landings figure is slightly lower in Eurostat than in UK Sea Fisheries Statistics due to slight methodological differences in the time of year the data are processed. For 2018 the difference is approximately 500 tonnes or 0.07 per cent difference.

¹³ The number of UK vessels differs between UK Sea Fisheries Statistics and Eurostat due to methodological differences. MMO use the UK fleet register to count the number of vessels across the whole UK plus the Islands (Guernsey, Jersey and Isle of Man) as at 31st December in the year being reported. Eurostat use the EU Community Fleet Register to enumerate vessel numbers. The figure reported here is from Eurostat to maintain consistency when comparing across European nations.

7. Annex 1: Methodology

7.1. Sources

7.1.1. Fishing Activity and Landings information

Fishers are legally required to provide information on their fishing activities. This includes what they caught, where they caught it, what type of fishing gear they used, and where they landed their catch. The format that fishers or their agents provide the information in to Fisheries Administrations depends on the length of the fishing vessel:

- Vessels over 10 metres are required to maintain logbooks of their fishing activity and provide landings declarations.
 - For UK vessels over 12m, this information must be submitted electronically in an e-logbook system.
 - Vessels between 10m and 12m may use paper logbooks.
- EU legislation does not require vessels 10 metres and under to keep logbooks, but in Scotland, these vessels are required to provide equivalent information on FISH1 forms.

7.1.2. Value of Landings

Legislation requires that buyers and sellers of fish have to be registered and have to supply Fisheries Administrations with sales notes. These sales notes can be in paper or electronic format and show what was paid for the fish being sold. With sales of fish into non-EU countries, it can take a long time for sales notes to be submitted. In these statistics, if a sales note for a given landing is not available, then the average price for that species of fish is used instead.

The value of landings presented in the data tables are nominal (not adjusted for inflation), except in Table 23 on page 72 where they are adjusted for inflation. Throughout this publication, percentage changes in values are presented in real terms adjusted to 2019 prices. The graphs in this publication also present real terms value. These statistics use calendar year deflators published by HM Treasury for the year being reported published in June of the production year, i.e. adjustment to 2019 prices has been done using Treasury deflators published in June 2020. These deflators are listed in Table 23.

7.1.3. Vessel Information

Fishers have to have a licence to be allowed to fish. UK Fisheries Administrations keep a record of every vessel that has a licence. This information includes the vessel's length, engine power, gross tonnage, age of the vessel, the port where it is registered to and its main fishing method.

7.1.4. Employment

Information on employment in the Scottish fishing fleet is gathered by Marine Scotland (MS) through a fisher employment survey distributed to each of the 18

Scottish port districts. MS Compliance Fisheries Officers complete the survey using their expert local knowledge of the fishers in their district. In Table 41, this information is put into context of the total employment in Scotland using data on the Scottish labour force obtained from the Annual Population Survey by the Office of National Statistics.

7.2. Data Processing

The process map on page 37 shows how data gets from sources into this publication. Marine Scotland maintains a database called Compass that contains all of the sea fisheries data, except employment, for all Scottish vessels' landings anywhere in the world plus all foreign vessels' landings into Scotland. The information from paper logbooks and FISH1 forms is entered into the Compass database by MS Compliance Fisheries Officers. The information from e-logbooks is processed and checked electronically before being imported into Compass.

The data from the Scottish Compass database are then imported into the UK-wide data warehouse called IFISH. IFISH adds the data from all the UK Fisheries Administrations together into one database. This is where most of the data presented here in Scottish Sea Fisheries Statistics comes from. Currently, vessel information comes from the older Scottish Fisheries Information Network (FIN) database, which is being replaced by the newer database Compass. In future publications, Compass will completely replace FIN.

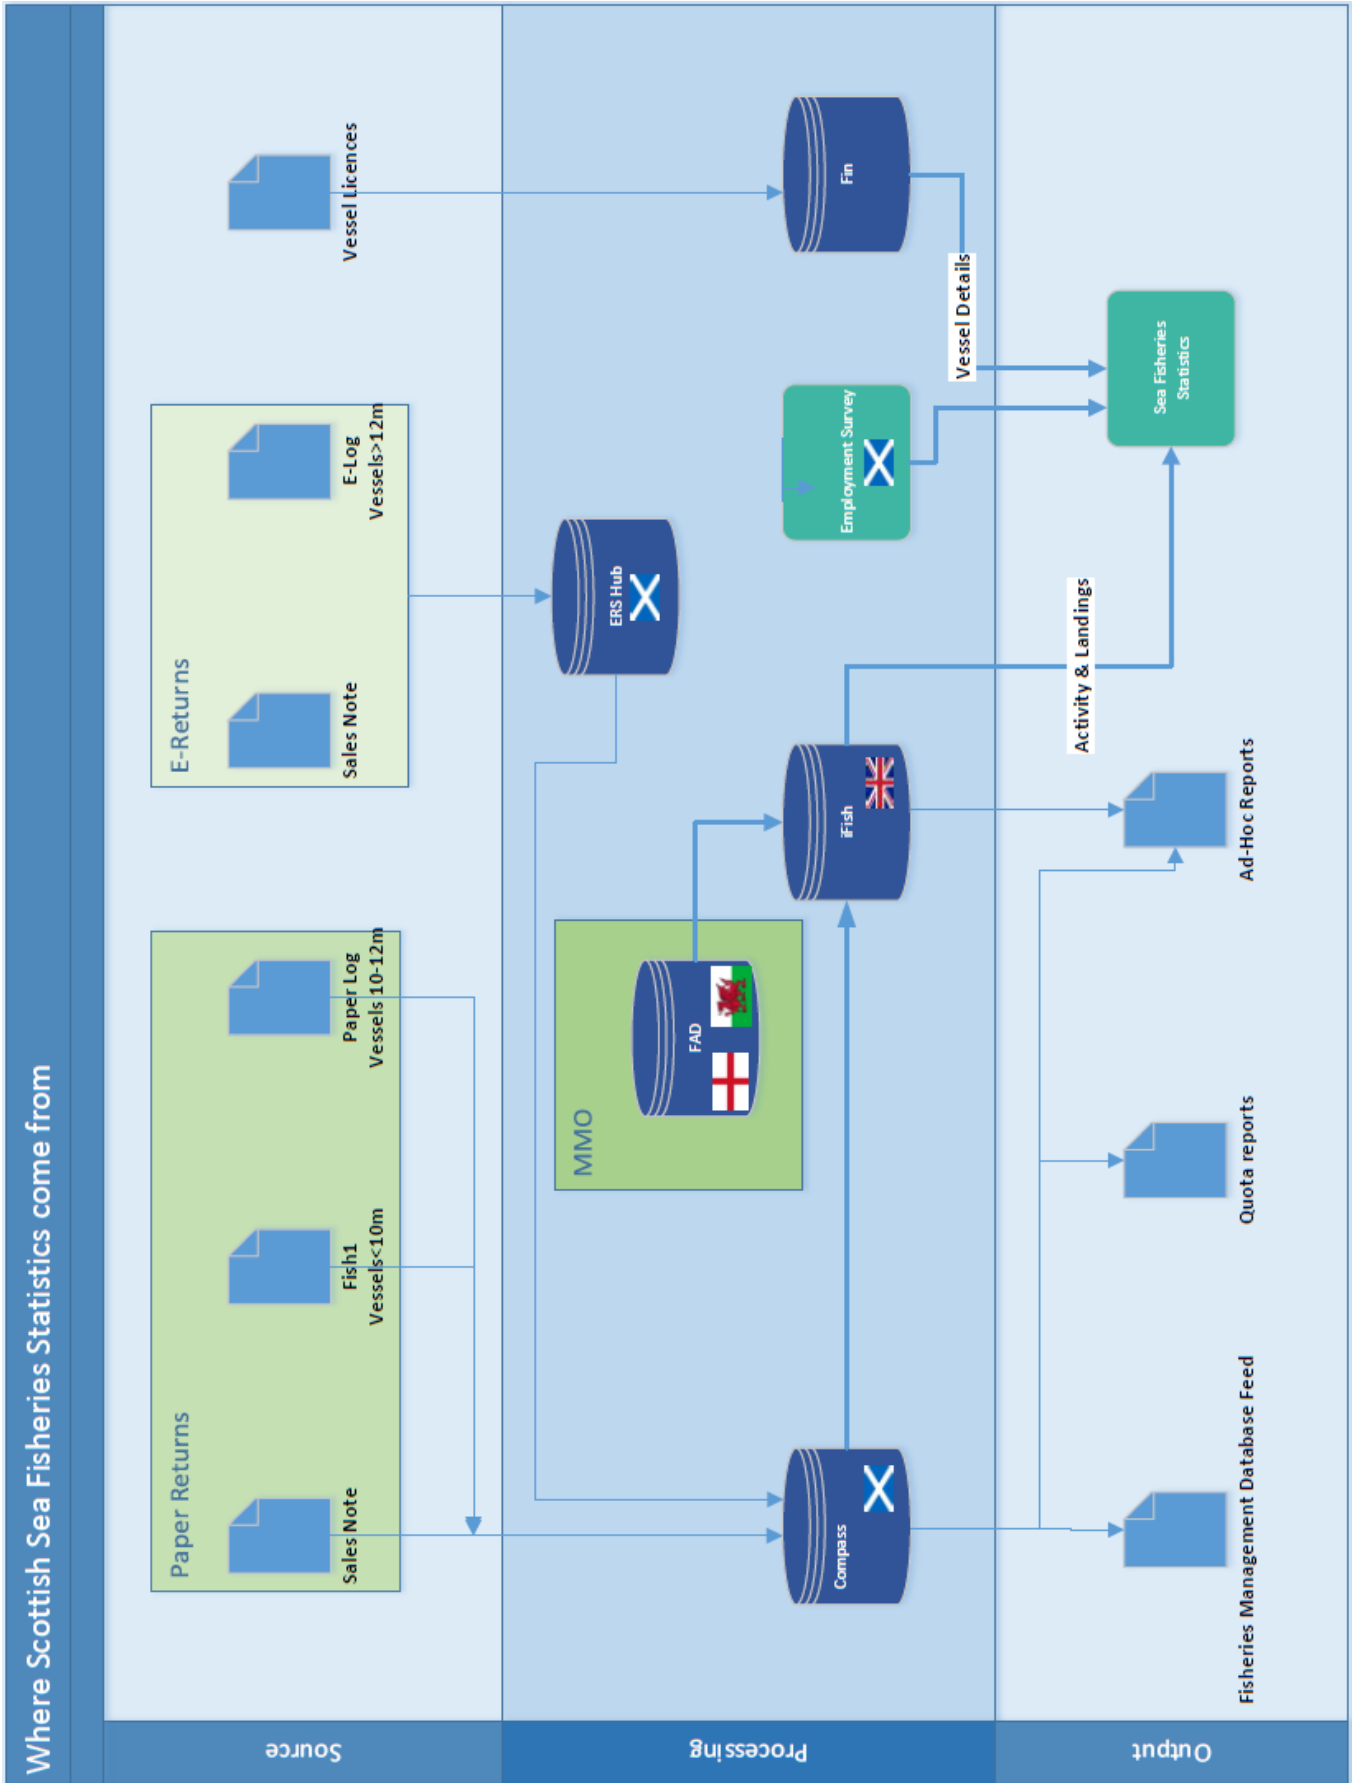

For producing this publication, the Marine Analytical Unit (MAU) in MS take a frozen 'cut' of data from IFISH and FIN (for vessel information only) for the previous five calendar years at the end of July. The data are then quality assured for publication (see the Quality section below).

7.3. Outputs and Publications

The Compass and IFISH databases are the sources of data for a range of different outputs and publications. As administrative data, the primary use of the data is to enforce the law on sea fisheries protection by UK Fisheries Administrations. In Scotland this is carried out by Marine Scotland Compliance. The data are also used to:

- monitor fishing quota uptake by each Fish Producer Organisation (FPO) on a weekly basis
- supply MS Science with fisheries data for marine science
- produce analysis and evidence to inform government policy and decision-making
- include the fishing industry in economic indicators
- inform the National Performance Framework indicator on sustainability of fish stocks
- assist in marine planning decisions
- answer requests for data

Process map of Scottish Sea Fisheries Statistics data

External data requests are often received from academics, environmental groups, the fishing industry, consultants on offshore developments, or people interested in information on their local community's fishing industry. The Marine Management Organisation and MS Science use Scottish data as part of their submissions to the EU Commission and the International Council for the Exploration of the Sea (ICES) to monitor the fishing industry and provide scientific advice on maintaining sustainable fisheries.

7.4. Quality

As National Statistics, this publication has been assessed by the UK Statistics Authority as being of the highest standards of trustworthiness, quality and value. Data quality is assured throughout the publication process from sources to final outputs.

Sea fisheries data in this publication come from administrative databases where the primary purpose of collecting the data is for sea fisheries protection. The Marine Analytical Unit (MAU) uses the data for the secondary purpose of producing this statistical publication. As administrative data gathered under legislation for law enforcement, the data form a census (a complete dataset) that records every voyage and landing by UK fishing vessels or by any vessel landing into the UK.

7.4.1. Illegal, unreported and undeclared fishing

MS Compliance assesses that Illegal, Unreported and Undeclared (IUU) fishing (sometimes called "black landings") as being very low with minimal impact on the trends shown in the data.

7.4.2. Data entry validation

When a fisher, agent or Fisheries Officer submits data to the database, there are automatic checks for logical inconsistencies, such as wrong combinations of ICES rectangle and sea area. When data is copied from the Scottish database Compass into the UK-wide data warehouse IFISH, there are more automatic checks to make sure the data are correct and that the data copy over correctly between the different databases. In completing the forms, fishers and agents choose from drop-down menus, which help to minimise data entry error.

7.4.3. Compliance checks

As MS Compliance use the data throughout the year for sea fisheries protection, the data are checked on an ongoing basis. If MS Compliance find errors in the data, they can request that fishers or agents supply correct data and amend the records. MS Fisheries Officers are experts on data reporting and the fishers in their port district, ensuring data quality when they enter FISH1 and paper logbook data and in finding and amending any data errors.

7.4.4. Expert user checks

The MAU also use the data throughout the year for producing reports on landings of quota fish for the Fish Producer Organisations (FPOs), for scientists in MS Science, and for internal and external queries. Expert users of the data, like the FPOs, give regular feedback on consistency between MAU's reports and their own internal records, providing a robust external check on data accuracy, at least for quota species that are the majority of fish landings. The Marine Management Organisation (MMO) use the UK data warehouse IFISH for their own work throughout the year, providing another expert check on data quality. Additionally the fishers and agents will check their own data to ensure they are fairly and accurately represented.

7.4.5. Statistical checks

The MAU undertakes multiple checks on the data before publication. The data are checked against the provisional publication for the same year and against the final statistics for the previous year and large changes or inconsistencies are investigated further. The same programs to query the database are run each year for consistency. Data between the Scottish database and UK-wide database are compared to ensure the data have been copied over correctly. High tonnage or high value landings are investigated for accuracy and very high or low prices for sales involving one tonne or more of fish are investigated further. When errors are identified, they are sent to MS Compliance Fisheries Officers in the relevant port district for correction. MAU quality assures the results before MS policy colleagues provide further sense checks based on their expert knowledge of the industry.

7.5. Limitations of the data

Due to the legal basis for collecting sea fisheries data, the quality of the data is high and forms a census, or complete record. Some limitations of the data include timeliness, lack of data on foreign vessels in UK waters or Scottish vessels operating far from Europe and limits on the precision of marine geography.

Information on landings of fish species not subject to quota, or fish landed by UK vessels abroad, can often take months for the information to be supplied. This is why provisional statistics are not published until 4-5 months after each year end and the final statistics are published in September. The MAU assessed that approximately 0.2% of landings (by value) of Scottish vessels' landings are omitted from the final published statistics each year due to delays in receipt of information on landings outwith the UK. However, this small incompleteness does not affect the overall trends shown by the statistics.

The data in the UK data warehouse IFISH are a complete record of all UK vessels' voyages and landings and of all foreign vessels' landings *into the UK*, but the UK does not have a system for recording foreign vessels' catches from UK waters if they land their catch abroad. That is because the legal responsibility for recording details of that vessel and its activities lies with its own country. Similarly, sales notes are

generally not supplied by a small number of Scottish-registered vessels operating far from Europe (sometimes called the far-water/distant-water fleet). As there are little data on prices of exotic species landed outside of Europe, prices are estimates only. This only affects a very small amount of the overall tonnage and value of landings.

A small number of records will be identified as erroneous but will not be amended immediately. This is because they serve as a legal record of what fishers and agents supplied to MS Compliance under sea fisheries protection law. If MS Compliance takes enforcement action, then known errors may not be able to be amended until the case is resolved. This affects a very small number of records so the impact on published figures and trends is minimal.

Some data presented in this publication by a specified geography – such as by local authority or ICES Area of fish capture – are limited by the complexity of marine geography. Data on area of capture are not available below the level of an ICES rectangle, a 30 nautical mile by 30 nautical mile area, and the data do not report whether fishing occurred in inshore or offshore areas. When considering terrestrial geographies such as local authorities or port districts, there is often a mismatch between these and marine geographies such as Scottish Marine Regions or ICES Rectangles.

7.5.1. Change in recorded landings by Scottish vessels since provisional statistics

The time lag between sales and the provision of sales notes can cause changes between provisional and final statistics for a given year. Value of landings information is derived from sales notes, which are submitted by Registered Buyers and Sellers. This information is matched up with the landing declaration submitted by the vessel to obtain values for each landing. If there is no sales note, for example when a UK vessel lands into a non-EU country, the value of the landing is estimated. The most accurate estimation is based on the average price for the same species in the same quarter of the previous year. If that method is not available, the database uses the next most accurate method based on the price for the same species in the previous quarter, and then opens up to the same species type, and so on. When a sales note is supplied for that landing, the estimates are replaced by the true figure from the sales note.

7.5.2. Revisions to provisional statistics

Compared to the provisional 2019 edition, the main statistics for 2019 have changed very little. However, pelagic tonnage and value have seen an increase due to a manual addition of a few mackerel landings which were missing from the IFISH database as a result of the vessels landing into more than one port on one voyage. The value of these landings was estimated using the average price for the same species into the same country of landing in 2019. Vessel numbers increased by two, with both additions being 10m and under vessels. Fisher numbers remained consistent with the provisional statistics.

Changes in statistics for 2019 between Provisional and Final Scottish Sea Fisheries Statistics 2019

	Tonnage	Value
Pelagic	2.9%	6.9%
Demersal	<0.1%	2%
Shellfish	0.8%	1.5%
TOTAL	1.9%	3.4%
Vessel numbers	0.1%	
Fishers employed	0%	

7.5.3. Revisions to previous years' final statistics

The landings tables present data for the past five years. Previous years' data are updated to ensure users have access to the latest data available. Revisions are typically small and affect landings information where data comes from logbooks, landing declarations and sales notes that can be amended for small changes (usually in the order of 0.2%) due to late data entry or rectification of errors. As these do not affect the main trends presented, they are not highlighted and not footnoted. Data older than five years is not updated.

The list of the main species displayed in the landings tables may change each year as the criterion for a species being a 'main species' is that the total value landed into the UK or by UK vessels is £2 million or more.

On the rare occasions that revisions are required in the previously published figures that *do* affect the main trends presented, the revised figures are marked "(r)" and suitably footnoted to explain the reason for the revision. The statistics are routinely revised between the provisional statistics and final statistics – see above. However, provisional statistics are always explicitly identified as such. Vessel numbers and employment remained unchanged as these data are collected once for the final version of each edition of the publication.

Changes in statistics for 2018 between Final Scottish Sea Fisheries Statistics 2018 and 2019 editions

	Tonnage	Value
Pelagic	-0.1%	-0.1%
Demersal	-0.2%	-0.2%
Shellfish	0.1%	2.9%
TOTAL	-0.1%	0.7%

Prior to the publication of the 2019 statistics, there was an update in the price estimation methodology affecting all species. This affects the methodology used for all price and value estimation since late 2016, leading to a small increase in overall value compared to previously released statistics since 2016. Estimated prices and values for Nephrops and scallops were the main species affected by this change,

leading to the change in shellfish value shown above. This statistics release has used the updated methodology for all affected years.

7.5.4. Comparability with other countries' statistics

EU legislation covers information requirements for vessels over 10 metres and for all buyers and sellers, which means that data are comparable for all countries within the UK and for all EU countries. The main difference between information collated in Scotland and that collated in the rest of the UK is that, through the FISH1 returns, Scotland obtains equivalent information on a full coverage basis for vessels of 10 metres and under. In the rest of the UK, this information is provided on a sample basis only. However, the vast majority of fish are caught by vessels over 10 metres, so the information is effectively comparable for all UK countries for most species.

The method for counting Scottish registered vessels is by totalling the number of *active* vessels registered in Scottish ports on 31st December of each year. In comparison, in the rest of the UK vessels are counted if they are registered (regardless of whether they are classed as active or not). This can lead to slight discrepancies between figures published at the Scottish level and those published at the UK level. Eurostat figures for vessel numbers come from the European Community Fleet Register vessel database rather than Marine Scotland's own vessel database. This can result in discrepancies for UK vessel numbers between UK and Eurostat publications. For 2018, this discrepancy was 10 fewer vessels (less than one per cent) in UK Sea Fisheries Statistics than in Eurostat.

7.6. Removal of Tables

During the production of the 2019 Scottish Sea Fisheries statistics, the decision was made to remove several tables from the publication. The reasons behind this decision are detailed below.

7.6.1. Method of Disposal

The table showing landings by method of disposal (formerly Table 32 in the 2018 publication) seemed to be uninformative and did not appear to present a true picture of fish products used for rendering. Following consultation with the Scottish Sea Fisheries statistics user group, the decision was to remove this table from the 2019 and future editions of the publication.

7.6.2. Vessel's by Main Fishing Method

During the production of the 2019 Scottish Sea Fisheries statistics, concerns were raised regarding the reliability of the main fishing method for active vessels due to the discontinuation of a data source.

Previous publications used fishing method as declared on a vessel's licence, which is updated when a new licence is applied for. However, this data source is no longer regularly kept up to date between licence applications. Further investigation found differences between the number of vessels using different fishing methods from the discontinued licence data source and those estimated from up to date data sources such as the declared gear by fishers used on a particular vessel voyage.

This means that for the 2019 report, all tables containing information on main fishing method have been removed from the publication. For future publications, MAU plans to develop a new methodology for robustly estimating the main fishing method of a vessel.

The affected and therefore removed tables are the following:

- Table 38: Number of active Scottish registered vessels by main fishing method as at 31st December 2019.
- Table 39: Number of active Scottish registered vessels by district and main fishing method as at 31st December 2019.
- Table 40: Number of Scottish registered vessels by main fishing method and length group as at 31st December 2019.

Furthermore, any charts and text discussing this data have been removed from the commentary.

8. Annex 2: Glossary of terms

Active Vessel is a fishing vessel that is registered and licensed to fish and marked as 'active' in the MS database. Fishers can request to be marked as 'inactive' if they do not intend to do any fishing. However, this does not mean that all vessels marked 'active' do any fishing in a given year.

Administration Port is a vessel's 'home', the port that is responsible for administration of the vessel, including its licence. A vessel can be registered to any port but will be administered from a port with a local Fisheries Administration office. This publication gives details of vessels and landings down to the level of port districts, or groups of ports that have one Marine Scotland office to administer the ports in that district.

Crofters are people who hold small plots of lands called crofts and usually engage in small-scale subsistence farming and other occupations. Some crofters also fish and are therefore licensed and reported in this publication.

Demersal fish live close to the seabed e.g. cod, haddock, monkfish. *Pelagic* fish live close to the surface.

e-Log or electronic logbooks are mandatory for vessels of 12m long or over, though under-12m vessels may also choose to use e-logs. A fisher has to record their fishing activity in a logbook and submit it to their fisheries administration.

Engine Power is a measure of the power of a fishing vessel's engine in kilowatts (kW). This helps to provide a more complete picture of vessel capacity than the number of vessels alone would. Where an engine has been permanently de-rated and this has been declared to the Register of Shipping and Seamen (RSS), this is the de-rated engine power; otherwise, it is the maximum continuous engine power (MCEP) declared to the RSS. Where neither of these is available, the registered engine power is used.

FISH1 forms are similar to logbooks but for ten metre and under vessels. Under Scottish legislation, these vessels have to submit electronic or paper FISH1 forms to Marine Scotland offices for entry into the database. As the other parts of the UK do not have legislation that enforces this, other Fisheries Administrations in the UK provide statistics on 10m and under vessels on a sample instead of full coverage basis.

Fishers Employed is defined as people working at sea on a commercial fishing vessel, classified as "Regular" or "Irregular" according to whether commercial fishing is their main occupation or not. Irregular was previously called part time. Crofters who gain some part of their living from fishing are also included.

Fishing Areas are defined by an international convention. The immediate waters around the UK are subdivided into ICES Sub-areas: IV (North Sea), VI (West of Scotland) and VII. VII is further divided into Western Approaches, VIIg,h; the Irish Sea, VIIa; and the English Channel, VIId,e. Each fishing area is also broken down into ICES rectangles. ICES areas are shown on the map in Figure 5 on page 18.

Fish Producer Organisations (POs) are institutions set up in accordance with EC regulations to improve the market for their members' catches. POs may also be granted responsibility by Fisheries Administrations for the management of fish quotas in addition to this function.

Gross Tonnage is a volumetric measurement of vessel capacity, or the amount of space inside the vessel, under the rules of the ITC69 (International Tonnage Convention).

ICES or the International Council for the Exploration of the Sea coordinates and promotes marine research on oceanography, the marine environment, the marine ecosystem, and on living marine resources in the North Atlantic. They provide impartial scientific advice on setting fishing quotas.

ICES Rectangles are areas of the sea defined by ICES (see above) that are 30 nautical miles (nm) by 30 nm. They have codes based on a grid reference e.g. '41E7'. A set of rectangles come together to form an ICES fishing area e.g. IVa Northern North Sea (see fishing areas above).

The landings data in this publication and data on fishing effort are also available by individual ICES rectangles in Scottish waters on the Scottish Government website.

Inshore fishing is within 12 (nm) of the coast. Only vessels registered to that country can fish within that area. Between 12 and 200 nm, called the offshore zone, all European Union member state vessels can fish in any EU member state's waters.

Landing Declarations provide information on the species, weight and presentation of landed fish. Under EU legislation, Scottish vessels landing into the UK are required to submit their log sheets to the authorities within 48 hours of landing for paper logbooks or 24 hours if provided electronically. Scottish vessels landing abroad are required to dispatch copies of their landings declaration to the vessels home port within 48 hours for paper logs or 24 hours for electronic submissions.

Live Weight Equivalent is the weight of fish when first removed from the water before it is processed aboard the vessel (for example by gutting). Where, for example, fishers report the gutted weight, the live weight is calculated by using a standard conversion factor based on the species and the presentation of the fish when it is landed. The conversion factors are worked out by scientific research.

Logbook entries provide details on fishing activities and voyages. Logbooks also detail the fishing gear used and net mesh size. The locations of catches are recorded in logbooks by ICES statistical rectangles and areas. Catch information for each fishing operation include details of the species caught. Scottish vessels landing into the UK are required to submit their log sheets to the UK authorities within 24 hours of landing, while those that land at foreign ports must dispatch copies of their log sheets to the vessels administration port within 24 hours.

Main Fishing Method refers to the most common method of fishing a vessel intends to use, as specified by the vessel owner on their licence application. The actual fishing gear used by the vessel in any one activity may not be the same as that for the declared main fishing method.

Marine Scotland is a Fisheries Administration that enforces sea fisheries protection via MS Compliance and manages Scotland's seas.

Nephrops (*Nephrops norvegicus*) are also known as Norway lobster, langoustine, Dublin Bay prawns or scampi. Not to be confused with other species that can also commonly be called 'prawns'.

Pelagic species are found mainly in shoals in midwater or near the surface of the sea e.g. herring and mackerel. *Demersal* species live near the seabed.

Port Districts are collections of individual ports that come together to form one unit for fisheries administration. Each port district is responsible for managing the vessels, fisheries and data reporting in their area. In Scotland, there are eighteen port districts (see the map on page 112).

Quota Fish are species that subject to international quotas. Quotas are the tonnage of fish of different species that may be legally landed from defined sea areas by individual countries. The U.K. Quotas are divided up and allocated to Fish Producer Organisations according to the number of Fixed Quota Allocation units held by the Producer Organisation and their member vessels. National quotas are negotiated as a share of the Total Allowable Catch (see below).

Register of Buyers and Sellers is a scheme of registration for Buyers and Sellers of first sale of fish and designation of fish auction sites. This requires Registered Buyers and Sellers to submit sales notes that show the details of the fish being bought and the price paid for it. Sales notes should be submitted within 24 hours of sale by the registered buyer of the fish, except at designated auction sites where the seller has the responsibility for submitting sale notes. Registered Buyers and Sellers with an annual turnover of €200,000 in first sale of fish are required to submit their sales notes electronically. See www.fishregister.gov.uk

Seining is a method for catching fish where the net is set on very long ropes designed to herd or contain the fish into the middle of the net. After the fish have been surrounded by the net, it is slowly hauled back to the vessel.

Shellfish in this publication covers all crustaceans, molluscs and cephalopods (like octopus).

Total Allowable Catch (T.A.C.) is the maximum permitted tonnage of a given species in a defined area that can be caught by vessels of any country. TACs are set at the December Council negotiations between the EU Member States and other Coastal States (Norway, Faroe Islands, Russia, and Iceland).

Trawling is when a vessel or two vessels (pair trawling) tow a net through the sea. Different net designs allow fishers to fish for pelagic fish, demersal fish or *Nephrops*.

9. Annex 3: Further Information

Other official publications on sea fisheries statistics include:

Marine Scotland

Scottish Sea Fisheries Statistics (this publication) is also available online:
<https://www.gov.scot/publications/>

Marine Scotland also publishes summary provisional statistics each year.
<https://www.gov.scot/publications/provisional-scottish-sea-fisheries-statistics-2019/>

Fisheries data is also available at the level of individual ICES rectangles in Scottish waters on National Marine Plan interactive (NMPi).
<https://marinescotland.atkinsgeospatial.com/nmpi/>

Marine Management Organisation (MMO), Department for Environment, Food and Rural Affairs (Defra)

UK Sea Fisheries Statistics is a comprehensive collection of statistics on the UK fishing industry, published annually.

www.gov.uk/government/collections/uk-sea-fisheries-annual-statistics

The UK Vessel List of registered and licensed vessels of over 10 metres length, published monthly.

www.gov.uk/government/collections/uk-vessel-lists

Monthly UK Sea Fisheries Statistics is a summary publication of landings into the UK, published monthly.

www.gov.uk/government/collections/monthly-uk-sea-fisheries-statistics

UK quota management spreadsheets showing uptake of fish catches by each producer organisation against their allocations for the year.

<https://www.gov.uk/government/statistical-data-sets/quota-use-statistics>

Food and Agriculture Organization of the United Nations (FAO)

FAO Yearbook of Fishery and Aquaculture Statistics, published annually with data relating to two years prior.

www.fao.org/fishery/publications/yearbooks/en

Eurostat

Fishery statistics from the European Union official statistics producer. It includes data from some non-EU countries for comparison.

(1) See Table 5. 'Scottish vessels - All landings' for nominal (unadjusted) values. Values in real terms were calculated by application of the HM Treasury Gross Domestic Product deflators for 2019 as below.

<https://www.gov.uk/government/statistics/gdp-deflators-at-market-prices-and-money-gdp-june-2020-quarterly-national-accounts>

Year	GDP deflator
2010	85.303
2011	87.044
2012	88.487
2013	90.163
2014	91.813
2015	92.347
2016	94.321
2017	96.106
2018	98.159
2019	100.00

(2) Main species are those landed by Scottish vessels with a value of £2 million or above in 2019.

(1) Main species are those where the quantity landed into Scottish districts was 20 tonnes or over in 2019.

(2) Dogfish, Gurnards, Skates and rays, Wrasses, Clams and Squid are groups of individual species. Some of these individual species may exceed 20 tonnes landed into Scottish districts.

(1) In 2010 the sea areas for Horse Mackerel were changed from IVa, IVb IVc to IVb,IVc,VIId.

(2) In 2017 Sprats was an 18-month TAC which ran until end June 2018.

(3) UK quota after exchanges can exceed the whole EU TAC as some quota can be 'carried over' into the next year within agreed limits.

(1) Includes NS Herring (IVa & IVb) and NS Herring (IVc).

(2) Includes NS Mackerel (IVa) and NS Mackerel (IVb & IVc) but excludes Mackerel from the Shetland Box, allocated on West of Scotland.

(3) Figures presented in this table include Scottish vessels that do not belong to a PO. Scottish vessels can belong to a predominantly English PO and vice-versa.

11. Annex 5: Districts and ports in Scotland

Ports and port districts in Scotland

Districts are shown in bold with their associated ports listed below.

Aberdeen (FO*)

Aberdeen
Arbroath
Catterline
Gourdon
Johnshaven
Montrose
Stonehaven

Anstruther (FO*)

Anstruther
Burntisland
Crail
Methil & Leven
Pittenweem
St Andrews
St Monans

Ayr (FO*)

Annan
Ayr
Ballantrae
Cumbraes
Drummore
Dunure
Girvan
Kirkcudbright
Largs & Greenock
Maidens
Portpatrick
Stranraer
Troon & Saltcoats
Whithorn

Buckie (FO*)

Buckie
Burghead
Findochty
Hopeman
Lossiemouth
Portknockie

Campbeltown (FO*)

Ardrishaig
Arran
Bruichladdich
Bute
Campbeltown
Carradale
Colonsay
Crinan
Gigha
Islay
Jura
Port Askaig
Port Ellen
Tarbert
Tayinloan
Tayvallich
West Loch Tarbert

Eyemouth (FO*)

Burnmouth
Cove
Dunbar
Eyemouth
Granton
North Berwick
Port Seton
St Abbs

Fraserburgh (FO*)

Fraserburgh
Gardenstown
Macduff
Pennan
Portsoy
Rosehearty
Sandhaven & Pitullie
Whitehills

Kinlochbervie (FO*)

Eriboll
Kinlochbervie
Scourie

Lochinver (FO*)

Culkein/Drumbeg
Kylesku
Lochinver

Mallaig (FO*)

Ardnamurchan
Arisaig
Corpach
Glenuig
Mallaig
Salen

Oban (FO*)

Coll
Fort William
Loch Buie (Mull)
Loch Scridain (Mull)
Luig
Oban
Tiree
Tobermory (Mull)

Orkney

Hoy
Kirkwall (FO*)
Rousay
S Ronaldsay
Sanday
Stromness
Stronsay
Tingwall
Westray

Peterhead (FO*)

Boddam
Peterhead
Port Errol

Portree (FO*)

Bracadale
Broadford
Dunvegan
Kyle
Portree
Sleat
Snizort
Strathaird
Torrison

Scrabster (FO*)

Dunbeath
Helmsdale
John O'Groats
Keiss
Lybster
Portskerra
Scrabster
Wick

Shetland

Central Mainland
Lerwick (FO*)
Northmavine
S Mainland & Fair Isle
Scalloway
Skerries
West Mainland
Whalsay
Yell, Fetlar & Unst

Stornoway (FO*)

Barra
Benbecula
Bernera (Lewis)
Berneray (N Uist)
Grimsay
Lochs
North Harris
North Uist
Portnaguran & Ness
Scalpay
South Harris
South Uist & Eriskay
Stornoway

Ullapool (FO*)

Achiltibuie
Aultbea
Avoch
Brora
Gairloch
Invergordon
Inverness
Portmahomack
Ullapool

* FO demarks the location of fishery offices, the administration base for each district.

A NATIONAL STATISTICS PUBLICATION FOR SCOTLAND

The United Kingdom Statistics Authority has designated these statistics as National Statistics, in accordance with the Statistics and Registration Service Act (2007) and signifying compliance with the Code of Practice for Official Statistics.

Designation can be interpreted to mean that the statistics: meet identified user needs; are produced, managed and disseminated to high standards; and are explained well.

Correspondence and enquiries

For enquiries about this publication please contact:

Marine Analytical Unit

Telephone: 0300 244 4000

Email: fisheriesstatistics@gov.scot

For general enquiries about Scottish Government statistics please contact:

Office of the Chief Statistician

Telephone: 0131 244 0442

Email: Statistics.enquiries@gov.scot

How to access background or source data

The data collected for this statistical bulletin are available via the [Scottish Government Sea Fisheries Statistics website](#). Data are available at the level of ICES statistical rectangles on the [ICES rectangle webpage](#) or alternatively on [National Marine Plan interactive](#).

You can also request sea fisheries data or queries on this publication to the email address and telephone number listed above.

Complaints and suggestions

If you are not satisfied with our service or have any comments or suggestions, please write to the Chief Statistician, 3WR, St Andrews House, Edinburgh, EH1 3DG, Telephone: 0131 244 0302 Email: Statistics.enquiries@gov.scot

If you would like to be consulted about statistical collections or receive notification of publications, please register your interest at www.gov.scot/scotstat
